FLEXmax Series
Charge Controllers
(FLEXmax 80, FLEXmax 60)
Owner’s Manual
About OutBack Power
OutBack Power is a leader in advanced energy conversion technology. OutBack products include true sine wave inverter/chargers, maximum power point tracking charge controllers, and system communication components, as well as circuit breakers, batteries, accessories, and assembled systems.

Contact Information
Address: 17825 – 59th Avenue N.E.
        Suite B
        Arlington, WA 98223 USA

Introduction

IMPORTANT:
This manual provides safety guidelines and installation information for the FLEXmax Series Charge Controllers. It does not provide information about specific brands of PV modules and supplies limited information on batteries. Contact the supplier or manufacturer of the PV modules or batteries for additional information.

Thank you for purchasing a FLEXmax Series Charge Controller (CC). These charge controllers offer an efficient, safe, multi-stage recharging process that prolongs battery life and assures peak performance from a PV array.

Each charge controller is designed to seamlessly integrate with other OutBack components and can be remotely monitored and configured (up to 1000 feet or 300 meters away) using the optional OutBack Power system displays.

Features

The FLEXmax Charge Controllers use continuous Maximum Power Point Tracking (MPPT), which seeks out the maximum power available from a PV array and uses it to recharge the batteries. Without this feature, the PV array does not operate at the ideal voltage and can only operate at the level of the battery voltage itself. (See page 97 for a description of MPPT.) Each charge controller continuously tracks the array’s maximum operating power.

The FLEXmax Series has two models available:

- **FLEXmax 80**: 80 amps maximum continuous output current (up to 40°C without thermal derating)
- **FLEXmax 60**: 60 amps maximum continuous output current (up to 40°C without thermal derating)

Both models have the following features:

- Supports 12, 24, 36, 48, and 60 Vdc battery voltages
- Backlit LCD display screen with 80 characters (4 lines, 20 characters per line)
- Last 128 days of operational data are logged for review
- Voltage step-down capability allowing a higher PV array voltage configuration
- Manual and auto-equalize cycle

Firmware

This manual covers FLEXmax firmware revision 003.003.000 or higher.
Soft Keys

Four “soft” keys are located directly below the LCD. The functions of the soft keys will vary depending on the location of the user within the menu structure. Some soft keys will be used for navigation. Some soft keys will be used for programming.

Soft key functions are identified by text in the LCD screen directly above the key (e.g., EXIT). In this manual, soft keys will be identified by brackets (for example, <EXIT>). Not every soft key may be used in some screens.
Standards and Requirements

All installations must comply with national and local electrical codes; professional installation is recommended.

**IMPORTANT:**
The charge controller is designed for indoor installation or installation inside a weatherproof enclosure. It must not be exposed to rain and should be installed out of direct sunlight.

**Rapid Shutdown**
The FLEXmax 60 and FLEXmax 80 charge controllers are not to be installed on controlled conductors of a PV Rapid Shutdown System (PVRSS). Controlled conductors are defined by the 2017 National Electrical Code and may be different from local requirements.

**Grounding**
This product is intended to be installed as part of a permanently grounded electrical system as shown in the wiring diagrams shown in Figure 6, Figure 7, and Figure 8.

- The FLEXmax equipment ground is marked with this symbol: ⬇️

The following important restrictions apply unless superseded by local or national codes:

- The negative battery conductor should be bonded to the grounding system at only one point in the system. If a GFDI is present, the battery negative and ground are not bonded together directly but are connected together by the GFDI device when it is on. All negative conductor connections must be kept separate from the grounding conductor connections.

- The FLEXmax controller is not intended to be wired into a positive-ground configuration. However, certain telecom applications may require this configuration. If a positive-ground system is necessary, consult www.outbackpower.com/forum/, where this subject has been discussed extensively.

- If damaged or malfunctioning, the FLEXmax should only be disassembled and repaired by a qualified service center. Please contact the local renewable energy dealer/installer for assistance. Incorrect reassembly risks malfunction, electric shock or fire.

**DC / Battery-Related Installation Requirements**

- Shut off all DC circuit breakers before connecting any wiring.
- Torque all the FLEXmax wire lugs and ground terminals to 4 Nm (35 in-lb).
- Copper wiring must be rated at 75°C or higher.
- Use up to 35 mm² (2 AWG) to reduce losses and ensure highest performance of the FLEXmax. Smaller cables can reduce performance and possibly damage the unit.
- Run positive and negative cables side by side.
  - Keep cables together as much as possible to allow the inductive currents to cancel.
  - Ensure paired cables pass through the same knockout and conduit fittings.
- DC battery overcurrent protection must be used as part of the installation. OutBack offers both circuit breakers and fuses for overcurrent protection.
Dimensions

Figure 3 FLEXmax 80 and FLEXmax 60 Dimensions

FLEXmax 80 Controller

16.25" (41.3 cm)

5.75" (14.6 cm)

FLEXmax 60 Controller

13.5" (34.3 cm)

4.0" (10.2 cm)
Mounting the Charge Controller

**IMPORTANT:**
Install the FLEXmax in an upright position out of direct sunlight.

Mounting directly to a FLEXware DC enclosure:

1. Remove the fan cover and bottom cover from the FLEXmax.
2. Insert a #10 × 3/8" sheet metal screw in the top hole on the side of the DC enclosure. This will act as a hanging screw for the keyhole slot at the top center of the FLEXmax.
3. Hang the FLEXmax on the top screw and line up its bottom two screw holes with the holes on the enclosure.
4. Insert a #10 × 3/8" sheet metal screw through each hole and tighten against the enclosure (screws are included with each DC enclosure).
5. Keep the cover off until wiring is completed.

The conduit nipple assembly creates a sealed connection from the FLEXmax to the enclosure.

Mounting to Plywood

Use 1-5/8" wood screws to secure the FLEXmax at the top slotted holes and other interior lower holes as needed, making sure the unit is straight and level.

Figure 4  Mounting the Charge Controller
Wiring

This section provides instructions on installing PV array wiring into the FLEXmax controller. See page 100 for more notes on PV array sizing and operation.

Wire and Disconnect Sizing

<table>
<thead>
<tr>
<th>IMPORTANT:</th>
</tr>
</thead>
<tbody>
<tr>
<td>❖ Wire sizes must comply with local and national codes. Input conductors and circuit breakers must be rated at 1.56 times the short-circuit current of the PV array (according to NEC). OutBack 100% duty continuous circuit breakers only need to be rated at 1.25 times the short-circuit current.</td>
</tr>
<tr>
<td>❖ Copper wiring must be rated at 75°C or higher.</td>
</tr>
<tr>
<td>❖ Use up to #2 AWG (33.6 mm²) to reduce losses and ensure high performance of the FLEXmax (smaller cables can reduce performance and possibly damage the unit).</td>
</tr>
</tbody>
</table>

**FLEXmax 80**
- The output current limit of the FLEXmax 80 is 80 amps.
- Install OutBack PNL-80-DC circuit breakers for disconnect and overcurrent protection.
- Use a minimum of #4 AWG (25 mm²) wire for the output between the FLEXmax 80 and the battery bus bar conductors.
- The largest PV array must have a rated short-circuit current of 64 amps or less under STC (Standard Test Conditions).
- Torque all the FLEXmax wire lugs and ground terminals to 4 Nm (35 in-lb).

**FLEXmax 60**
- The output current limit of the FLEXmax 60 is 60 amps.
- Install OutBack PNL-60-AC/DC or PNL-80-DC circuit breakers for disconnect and overcurrent protection.
- Use a minimum of #6 AWG (16 mm²) wire for the output between the FLEXmax 60 and the battery bus bar conductors.
- The largest PV array must have a rated short-circuit current of 48 amps or less under STC (Standard Test Conditions).
- Torque all the FLEXmax wire lugs and ground terminals to 4 Nm (35 in-lb).

Please refer to the NEC and other electrical codes for recommendations on PV array cable sizing and recommended length and ampacity.
Wiring Compartment

WARNING: Shock Hazard
Make sure all DC circuit breakers are OFF (open) BEFORE making any wiring connections. Use a DVM to check for voltage on all wires.

The PV– (negative) and BAT– (negative) terminals are connected internally. Only one negative wire may be needed to connect to the (–) wire lugs if the PV– and BAT– conductors are bonded at the negative bus bar.

See Figure 6, Figure 7, and Figure 8 for sample wiring diagrams.

CAUTION: Equipment Damage
Each FLEXmax requires its own PV array. DO NOT PARALLEL FLEXmax PV+ and PV- TERMINALS ON THE SAME ARRAY!

An optional battery Remote Temperature Sensor (RTS) is recommended for accurate battery charging.

- Only one RTS is needed for multiple OutBack inverter/chargers and charge controller units when the system includes an OutBack HUB and a system display.
- When one RTS is used, it must be connected to the component plugged into PORT 1 of the HUB.
Figure 6  Wiring Diagram - Single Charge Controller with PV Array
Figure 7  Wiring Diagram – Charge Controller with PV Array and Inverter
Figure 8  Wiring Diagram – Charge Controller with PV Array Ground Fault Protection
Operation

Operation of this unit consists of monitoring screens and programming screens. The majority of programming screens are accessed using the main menu. See page 27.

Power Up Screens

**IMPORTANT:**
- The default settings of the FLEXmax are for a 12 Vdc battery bank. Change the setting after powering up if a different battery voltage is used.
- Once set, the FLEXmax retains the nominal voltage setting. Following any type of shutdown or disconnect, it will return to operation automatically.
- The PV array voltage is automatically detected. The PV array voltage must never exceed 150 Vdc.
- Restore the FLEXmax to factory default settings (see page 56) and reset the nominal voltage any time the system is substantially revised or the controller is relocated.

The FLEXmax uses power from the battery bank to operate. The battery voltage must be at least 10.5 volts or higher to power up the FLEXmax. When battery power is detected, the FLEXmax will go through a series of power-up screens.

**To power up the charge controller:**
1. Ensure PV and battery circuit breakers are OFF.
2. Turn ON the battery circuit breaker only.
   - The FLEXmax will show the system battery voltage in the upper right corner of the screen. If the screen reads **Low Battery Voltage**, see the **Troubleshooting** section on page 93.
   - If the Australian version was previously selected, AU will be displayed in the lower right corner of the screen.

**To change version settings:**
While turning on the circuit breaker, press and hold the first and third soft keys to bring up the **Select Version** screen. Changing the version settings requires entering a password.

**NOTE:** This will reset the FLEXmax to default settings. It may be necessary to re-enter previous settings.

**To change the system password:**
1. Press <**NEXT**> or <**SEL**> when the **Select Version** screen appears on power up. This will open the **PASSWORD** screen.
2. Press <**<**> or <**> to reduce the number from 150 to 141.
3. Press <**ENTRA**> or <**ENTER**> to enter the new password.

**Figure 9  Powering up the FLEXmax**

**Select Version** offers two types of options. The English (default) or Spanish selections offer standardized charge settings in two languages. Selecting Australian leaves the menus in English, but changes the charging parameters. (For details, see Table 6 on page 101.)
Version and/or Voltage Setting Screens

Once the password has been entered, the display will return to the Select Version screen.

1. Press <NEXT> or <SEL> to cycle through the version choices of:
   - English,
   - Australian, or
   - Espanola.

2. When the desired version is displayed, press <ENTER> or <ENTRA> to proceed to the confirmation screen.

3. Press <YES> to confirm the selection.

The SYSTEM VOLTAGE screen appears next.

The FLEXmax automatically detects the system's battery voltage and indicates it by placing two ^^ symbols below the value.
- If the value indicated is correct, press <ENTER>.
- If the value indicate is not correct for the present system, press <--> to move the ^^ to below the correct voltage.
- Press <YES> to confirm the selection.

The Status screen is the last screen to be displayed after startup. The soft keys below the Status screen navigate to the main menu and the End-of-Day summary screen. See page 19 for details on the Status screen.

Figure 10 Changing the Version Setting
Status Screen

The status screen displays system information. See page 20 for detailed information of the different modes of operation.

The optional OutBack system display shows CC (Charge Controller) status screens for convenient distant viewing from the installation location. See page 61 for the FLEXmax screens displayed on the MATE3 or MATE3s. Please see pages 73 to 85 to view the FLEXmax screens displayed on the MATE or MATE2.

The PV voltage will slowly rise to the battery voltage level even when the PV breaker is off — this is normal as the PV capacitors charge up.

Figure 11 Status Screen

Navigation

Pressing the first soft key (SK1) opens the main menu screen.

Pressing SK2 opens the end-of-day summary menu and logging.
End-of-Day Summary Screen

The end-of-day summary screen appears after one hour of continuous *Sleeping* (see page 25). This screen can be opened any time by pressing the second soft key while in the status screen, providing a summary up to that point.

**End-of-Day Screen**

- **Day (up to 128 days)**
- **Accumulated Amp-hours**
- **Accumulated kWh**
- **Total Power**
- **Peak Input Voltage**
- **Peak Output Current**
- **Peak Output Power in**
- **Maximum Battery Voltage Obtained**
- **Accumulated Absorb Time**
- **Minimum Battery Voltage Obtained**
- **Accumulated Float Time**

**NOTE:**

When finished viewing the end-of-day screen(s), be sure to return the display to the status screen. Otherwise, it will not reset the counters when the sun rises the next morning. The values will continue to accumulate.

Figure 12 End-of-Day Summary Screen
Navigating End-of-Day Screens & Data Logging

**Status Screen**

- **In**: 11.6V 0.0 A
- **Out**: 13.8V 0.0 A
- **0.000 kW 0.0 kWh**
- **AUX**: OFF Sleeping

Pressing the second soft key (SK2) opens the end-of-day summary menu/logging.

**End-of-Day Screen**

- **Today**: 000Ah 00.0kWH
- **011Vp**: 00.0Ap 0.00kWp
- **MAX**: 14.7 V ABS 01:00
- **MIN**: 14.6 V FLT 00:00

Press SK2 to open the CLEAR LOG screen.

Press SK3 to open the previous day’s summary screen. Continuing to press this soft key will cycle back through the last 128 daily summary screens.

**CLEAR LOG Screen**

The daily statistics or the accumulated statistics are stored on the charge controller’s static memory. A new log “day” begins when the controller enters Wakeup. (See page 26.) Logs accumulate for up to 128 days. See pages 77 and 78 for details.

**End-of-Day Screen**

- **Today**: 000Ah 00.0kWH
- **011Vp**: 00.0Ap 0.00kWp
- **MAX**: 14.7 V ABS 01:00
- **MIN**: 14.6 V FLT 00:00

This data log can be downloaded to an SD card. A MATE3-class system display is required for this download. See page 71 for details on this function.

**Figure 13 Navigating the End-of-Day Summary Screen**
Modes of Operation

The FLEXmax has 25 different modes that will display on the status screen. These messages will vary with function. The FLEXmax modes consist of various charging stages, equalization, various reasons for stopping charging, and certain specialized operating modes.

The amount of time required before starting operation is dependent on the module type, ambient temperature, and the amount of sunlight directly on the PV array. Normally, the charge controller starts operation in the morning within a few minutes of the PV array being exposed to direct sunlight.

The FLEXmax modes of operation will change occasionally during the day based on the PV array output and the battery system state of charge. The FLEXmax operating modes are displayed at the bottom right hand corner of the status screen. See Figure 11.

Figure 14 shows an example of the various stages of operation during battery charging and the messages shown during each stage. Battery charging is described in detail on page 98.

Absorbing

The FLEXmax is in the Absorbing stage of a three-stage cycle, regulating the battery voltage at the Absorbing voltage set point. While the batteries are held at this voltage, the ChgT counter in the Misc menu counts up from zero toward the user-defined Absorb Time Limit. (See pages 47 and 52.) The charger will exit this stage and enter the Float stage if the ChgT timer reaches the time limit, or if the Absorb End Amps setting is reached.

If the battery voltage drops below the Absorbing voltage (see page 29), the FLEXmax reverts back to the Bulk charge stage and displays MPPT Bulk as shown on page 24. The ChgT counter will begin counting back toward zero. Lower voltages will cause the timer to subtract minutes at a faster rate, as shown on Table 1 on page 23.

</tbody>
</table>

Auto Start (Auto ReStart)

This setting allows the user to choose between continuous MPP tracking or occasional restarts of the sweeping process. A restart means the controller abandons the existing MPP and “re-sweeps”, or begins gathering new power point data. See page 55 for more information.
- Mode 1: Once every 1.5 hours in the Bulk charging stage
- Mode 2: Once every 1.5 hours in the Bulk, Absorbing and Float recharging stages
- Mode 0: Auto ReStart is disabled completely. It will continuously track the maximum power point without starting over.

NOTE: If enabled, AutoStart also occurs during the MPPT EQ cycle. See page 25.

BatTmpErr

The battery temperature sensor is shorted or damaged. Charging will not be temperature compensated. (The cooling fan will continuously operate.) See RTS compensation on page 53.

BatTooHot

The battery temperature sensor has detected a battery temperature of over 50°C. The FLEXmax will stop charging the battery and wait for the battery to cool below 50°C.

Charged

There is an external DC source other than PV keeping the battery above the Float voltage set point (see page 29). The FLEXmax will stop charging because it is not needed. The display may also appear when the cycle is transitioning from Absorbing (upper target voltage) to Floating (lower voltage).

EQ

The charger is in a cycle of equalization. (See page 45.) This is the time elapsed in hours and minutes since the BATTERY EQUALIZE VOLTS set point was met.

If this set point is not maintained, the controller will revert back to MPPT EQ. (See page 25.) The EQ timer will pause until the batteries are regulated at the BATTERY EQUALIZE VOLTS set point again. The paused time can be viewed in End-of-day Summary (see page 20).

EQ Done

Once the set EQ time (between 1 and 7 hours) has successfully completed, the FLEXmax will transition to Float stage. EQ Done will be displayed either until a button is pressed or the next morning’s wakeup. The FLEXmax will transition to Float stage at the end of the completed equalization cycle.
EX-Absorb

There is an external DC source other than PV keeping the battery above the *Absorbing* voltage set point. The FLEXmax will stop charging because it is not needed.

Floating

The FLEXmax is in the *Float* stage of a three-stage cycle, regulating the battery voltage at the *Float* voltage set point. This stage is temperature compensated. (See page 99.) If the battery voltage drops below the *Float* voltage, the FLEXmax will employ the MPPT function to draw more power from the PV array. (This may occur if the batteries are powering loads.) If this happens, the operating mode will change to *MPPT Float*. (See below.)

GT Mode

The FLEXmax is in Grid-Tie mode. In a system with an OutBack grid-interactive inverter, a HUB, and a system display, the FLEXmax will display *GT Mode*, if and only if, the inverter is in Sell mode and the FLEXmax is in the *MPPT BULK* or *MPPT FLOAT* modes. This message also indicates that Grid-Tie mode communication has been established between the inverter and charge controller. *GT* must be selected in the *MPPT Mode* advanced menu in order to be viewed. (See page 50.)

High $V_{oc}$

This indicates the PV array’s open-circuit voltage is too high for the controller to safely operate (> 145 Vdc). This should only occur with systems using 72 Vdc nominal PV arrays in very cold temperatures (below –15°C / 5°F). The FLEXmax will automatically restart operation once the PV array’s open-circuit voltage falls to a safe level (145 Vdc or lower).

---

**CAUTION: Equipment Damage**

Voltages in excess of 150 Vdc are likely to damage the FLEXmax controller. The PV array should be designed to avoid ever reaching these voltages.

---

Low Light or Snoozing

A *Low Light* or *Snoozing* mode indicates that the PV voltage is high enough to activate the FLEXmax, but there is not enough current available to charge. During the initial tracking (see *Wakeup* and *Tracking*), if it is determined to be too late (or too early) in the day, the FLEXmax will display *Low Light* for a few seconds and then display *Snoozing* for five minutes (default). This reduces energy usage and unnecessary powering of the FLEXmax. This message is also displayed in extremely cloudy weather.

MPPT Bulk

This is a Maximum Power Point Tracking mode which harvests the maximum wattage available from the PV array. The controller is trying to regulate the battery voltage towards the *Absorbing* voltage set point. Normally the charge controller enters this mode at the beginning of the day or when a new charge cycle begins. The controller may also enter this stage if there is not enough PV energy to maintain a different stage, such as *Absorbing*. See page 22 for more information.
MPPT Float
This is a Maximum Power Point Tracking mode which harvests the maximum wattage available from the PV array. The controller is trying to regulate the battery voltage towards the Float voltage set point. Normally, the charge controller enters this mode if it was in the Floating mode (see above) and there was not enough energy to maintain the battery voltage.

MPPT EQ
The equalization cycle has started and the charge controller is trying to regulate the batteries at the Battery Equalize Volts set point. Once this voltage has been reached, the displayed mode will change to EQ.

Before equalizing, battery loads should be turned off and the battery should be charged so the charge controller can quickly reach the EQ voltage set point. Otherwise, the charge controller may have difficulty reaching or maintaining the equalization process.

Equalization is not battery temperature compensated.

New Voc
The FLEXmax is measuring a new open-circuit panel voltage (Voc). This mode tells the user that external conditions have changed. After displaying this message, the charge controller will enter Tracking mode to perform power point tracking again.

OvrCurrent
This condition occurs if more than 6 amps flows from the battery to the FLEXmax, or if more than 100 amps is drawn from the FLEXmax by the battery. To reinitiate power production, press <RSTRT> in the Misc menu (see page 48). If this continues to occur, the unit may be malfunctioning.

Over Temp
The FLEXmax is too hot. If this message appears, carefully check to see if the heat sink is extremely hot. To help control its operating temperature, avoid installing the FLEXmax in direct sunlight.

Re-Cal
There are certain conditions that can confuse the current measuring method in the FLEXmax. If this happens, the FLEXmax will temporarily stop and re-calibrate. This may happen because of high temperatures or current flowing from the battery. After displaying this message, the charge controller will enter Tracking mode to perform power point tracking again.

Sleeping
The PV voltage is two volts less than the battery voltage. This normally appears at night, when no PV energy is available. This may also appear during the day when the FLEXmax is transitioning between certain states, or due to other conditions. After three hours of Sleeping, the FLEXmax will transition to Zzzzz... mode.
### Operation

#### Sys Error

This indicates an internal non-volatile memory error. The unit will stop operating when this message is displayed. Support may be required.

#### Tracking

In **Tracking** mode, the FLEXmax is doing an initial tracking of the panel voltage from $V_{oc}$ towards battery voltage after wakeup. This is also displayed when the controller transitions from a target set point (Absorbing, Floating, or EQ) to the MPPT state (MPPT Bulk, MPPT Float, or MPPT EQ).

#### Unloaded

The battery terminals have become disconnected. This may mean that the battery circuit breaker has tripped. It can also appear if the nominal battery voltage is set too low.

#### Wakeup

As the PV open circuit voltage ($V_{oc}$) rises above the battery system voltage by two volts, the FLEXmax prepares to deliver power to the batteries, although it does not perform MPPT in this mode. During this period (initial tracking), the FLEXmax is calculating the PWM duty cycles, turning on power supply voltages in the proper sequences, and making internal calibrations. It also measures a new $V_{oc}$ at this time. In **Wakeup**, the daily statistics of a single FLEXmax (amp-hours, kilowatt-hours, etc.), will accumulate into the total statistics. The daily statistics and the end-of-day summary will clear, and the controller will begin logging a new “day”. A FLEXmax combined with a HUB and a MATE-class system display will log this information at midnight. In a MATE3-class system display, the data logging will occur at the interval scheduled in the data logging parameters.

#### Zzzzz...

The FLEXmax will display Zzzzz... after 3 hours of continuous **Sleeping**. This transition indicates that the controller recognizes it is night. It will perform **Wakeup** when voltage is available (see above).
Initial Operation

Turn the PV input circuit breaker **ON**. The FLEXmax automatically detects the PV input voltage.

The FLEXmax enters **Wakeup**, transitions to **Tracking**, and prepares to charge the batteries by tracking the maximum power point of the PV array.

During the initial tracking, the input PV source is gradually loaded from the open-circuit voltage (Voc) to ½ of the Voc. Within this range, the FLEXmax seeks the maximum power point.

When the FLEXmax goes into **Re-Cal**, **Auto Restart**, or **Wakeup**, modes, among other conditions, it performs an initial tracking.

If PV voltage registers **000V** when the PV circuit breaker is ON, check the polarity of the PV connections.

**Figure 15  Initial Operation**

Changing the Settings on the FLEXmax

Accessing the Main Menu

The main menu allows the user to adjust and calibrate the FLEXmax for maximum performance.

From the status screen, press **SK1** to open the main menu screen.

To return to the status screen from the main menu, press **<EXIT>** (also **SK1**).
From the main menu, a user can choose among the following FLEXmax functions by aligning the arrow next to the desired selection.

- **Charger**—CHARGER SETUP
  Adjusts the Current Limit, Absorbing, and Float recharging voltage set points.
  See page 29 for details.

- **Aux**—AUX OUTPUT CONTROL
  Provides a secondary control circuit for a vent fan, error alarm, and other system-related additions.
  See page 30 for details.

- **Light**—BACKLIGHT CONTROL
  Adjusts the backlighting of LCD screen and soft key buttons.
  See page 44 for details.

- **EQ**—BATTERY EQUALIZE
  Activates battery equalization recharging (manually or automatically).
  See page 45 for details.

- **Misc**—MISCELLANEOUS
  Additional settings and service information.
  See page 47 for details.

- **Advanced**—ADVANCED MENU
  Optimizes/fine-tunes the charge controller.
  See page 49 for details.

- **Logging**—DATA LOGGING
  Displays recorded power production information.
  See page 57 for details.

- **STATS**—STATISTICS
  Displays recorded peak system information and cumulative kilowatt-hours and amp-hours.
  See page 58 for details.

**Figure 17 Main Menu**
Charger Screen

Charging settings should follow the battery manufacturer’s recommendations. This screen allows changes to the recharging voltage set points if the default settings do not match the battery manufacturer’s recommendations. (For an explanation of battery charging, see pages 98 and 99).

- **Current Limit**
- **Absorbing**
- **Float**

The default charger output current limit setting is:

- 80 amps for the FM80, and
- 60 amps for the FM60.

This setting is adjustable from 5 to 80 amps.

---

**IMPORTANT:**

- Check the battery manufacturer’s recommendations for the optimal charging settings for the type of batteries being used.
- An appropriate circuit breaker, or overcurrent device, must be used between the battery and the FLEXmax.
- If a battery remote temperature sensor (RTS) is used, set the **Absorbing** and **Float** setting voltage based on a 25°C/77°F setting. RTS compensated voltage values can be viewed in the **Advanced** menu screen under the **RTS Compensation** heading.

---

**Main Menu**

To access the Charger screen and adjust the settings:

1. From the main menu, press the <left> or <right> soft key to move the ➔ to the left of the **Charger** function.
2. Press <GO> to open the **Charger** screen. The ➔ indicates which set point is selected.
3. Press <down> to move the ➔ to the set point that needs to be changed.
4. Press <left> to increase the value or <right> to decrease the value.

**Figure 18 Charger Setup Menu**

To Exit:

- Press <EXIT> once to return to the main menu.
- Press <EXIT> twice to return to the status screen.
# Aux Screens

The Aux (Auxiliary) is a secondary control circuit — essentially, a small power supply that provides a 12 Vdc output current (up to 200 milliams / 2.4 watts) to an isolated load. It is either **ON (Active High)** with 12 Vdc available at the output or **OFF (Active Low)** with 0 Vdc at the output. It can also be set to **AUTO**, so that it activates when certain criteria are met.

The AUX output can respond to specific criteria and control cooling fans, vent fans, load diversion, fault alarms, and automatic generator control. In some cases, such as the **PV Trigger, Night Light**, or **Diversion:Relay** applications, the polarity of the output can be reversed so that a lack of power activates the output. This function is controlled through the **Aux Polarity** screen in the **ADVANCED MENU**. (See page 56.)

**NOTE**: **Diversion:Relay** and **Diversion:Solid St** can be used for AC coupling applications.

The Aux output can also be controlled externally through the system display. See the literature for the system display (if used) for details.
- Only one **AUX MODE** can operate at a time (even if other modes have been preset).
- See Figure 27, page 42, for an auxiliary setup wiring diagram example.

## Table 2 Aux Mode Functions

AUX MODE Screen Navigation

To access the AUX MODE screen and adjust the settings:

1. From the Main Menu, press <←> or <→> to move the ➔ to the left of **AUX**.
2. Press <GO> to open the **Aux** screen.
3. Press <NEXT> to cycle through the available auxiliary modes.
4. Press <MODE> to cycle through the mode set points **ON**, **OFF**, or **AUTO**. In **AUTO** mode, the function will automatically activate when a user-determined value is met and deactivate (or shut down) when other conditions are met, such as a certain amount of time passing.
5. Press <SET> to select the set point(s) (if available).
6. Press <EXIT> once to return to the main menu.
7. Press <EXIT> twice to return to the status screen.

**NOTE:** If more than 10 minutes have passed since any activity, the **PASSWORD** screen becomes active, requiring the user to reenter the password (141).
Vent Fan (AUX Mode)

This mode is intended to operate a vent fan for a battery enclosure which helps ventilate hydrogen gas from the enclosure. If the voltage remains above the threshold voltage set point, the vent fan will remain active.

When the voltage falls back below the set point, the vent fan will continue running for another 15 seconds, then turn off.

To set the mode for Vent Fan:

1. From the Main Menu, press < or > to move the cursor to the left of Aux.
2. Press <GO> to open the AUX MODE screen.
3. The Vent Fan screen should be the first default screen to display. If any other mode screen is displayed, press <NEXT> to cycle through the available modes until Vent Fan is displayed again.
4. Press <MODE> to switch between ON, OFF, or AUTO.
   - ON activates the Aux output.
   - OFF deactivates the Aux output.
   - AUTO controls the output according to the criteria of the selected Aux mode.

To change the set points for Vent Fan:

1. Press <SET> to advance to the set point screen.
2. Press <VOLT> to advance to the VENT FAN VOLTS screen.
3. Press < or > to increase or decrease the value.
4. Press <BACK> to return to the Vent Fan set point screen.
5. Press <EXIT> to return to the AUX Mode screen.

To Exit:

- Press <EXIT> once to return to the main menu.
- Press <EXIT> twice to return to the status screen.

Figure 20 Setting the Vent Fan Aux Mode
PV Trigger (AUX Mode)

This mode is intended to operate an alarm, or relay that disconnects the PV array, when PV input exceeds the threshold voltage set by the user. The mode turns off the alarm or PV disconnect after the PV voltage decreases below the threshold for a time period set by the user.

**CAUTION: Hazard to Equipment**

Do not exceed 150 Vdc or the FLEXmax could be damaged.

---

**To set the mode for PV Trigger:**

1. From the Main Menu, press `< ↔>` or `< ↔>` to move the `→` to the left of `Aux`.

2. Press `<GO>` to open the `AUX MODE` screen.

3. Press `<NEXT>` until `PV Trigger` is displayed in the `AUX MODE` screen.

4. Press `<MODE>` to cycle through `ON`, `OFF`, or `AUTO`.

   - `ON` activates the `Aux` output.
   - `OFF` deactivates the `Aux` output.
   - `AUTO` controls the output according to the criteria of the selected `Aux` mode.

   Indicates `Aux Polarity` is Active High

---

**To change the set points for PV Trigger:**

1. Press `<SET>` to advance to the set points screens; `<VOLT>` and `<TIME>`.

2. Press `< ↔>` or `< ↔>` to increase or decrease the values.

3. Press `<BACK>` to return to the set point screen.

4. Press `<EXIT>` to return to the `AUX Mode` screen.

**To Exit:**

- Press `<EXIT>` once to return to the main menu.
- Press `<EXIT>` twice to return to the status screen.

---

**Figure 21 Setting the PV Trigger Aux Mode**
Error Output (AUX Mode)

This mode is useful for monitoring remote sites. It is intended to signal when the charge controller has not charged the batteries for 26 hours or more or if the battery voltage has fallen below the threshold voltage for more than 10 minutes. The 26-hour timer can be viewed. When set as Active Low, it can operate an alarm by sending a signal through a modem to a computer to alert the operator of the condition.

To set the mode for Error Output:

1. From the Main Menu, press <--> or <-> to move the -> to the left of the Aux function.
2. Press <GO> to open the AUX MODE screen.
3. Press <NEXT> until ERROR OUTPUT is displayed in the AUX MODE screen.
4. Press <MODE> to cycle through ON, OFF, or AUTO.
   - ON activates the Aux output.
   - OFF deactivates the Aux output.
   - AUTO controls the output according to the criteria of the selected Aux mode.

NOTE: To advance to the timer screen, press <SET>. This timer counts up to the 26-hour limit before the AUX output is activated.

The voltage set point for this mode can also be changed.

To change the set point for ERROR OUTPUT:

1. Advance to the timer screen as noted above.
2. Press <VOLT> to advance to the ERROR LOW BATT VOLTS screen.
3. Press <-> or <+> to increase or decrease the value.
4. Press <BACK> to return to the ERROR OUTPUT set point screen.
5. Press <EXIT> to return to the AUX Mode screen.

To Exit:
   - Press <EXIT> once to return to the main menu.
   - Press <EXIT> twice to return to the status screen.

Figure 22 Setting the Error Output Aux Mode
Night Light (AUX Mode)

This mode is intended to operate a user-provided, low wattage light for as long as the charge controller remains in Sleep mode or for the ON time set by the user. OFF is the default value.

To set the mode for Night Light:
1. From the Main Menu, press <←> or <→> to move the → to the left of the Aux function.
2. Press <GO> to open the AUX MODE screen. The ↑ indicates that the mode supports polarity. See page 56.
3. Press <NEXT> until Night Light is displayed in the AUX MODE screen.
4. Press <MODE> to cycle through ON, OFF, or AUTO.
   - ON activates the Aux output.
   - OFF deactivates the Aux output.
   - AUTO controls the output according to the criteria of the selected Aux mode.

To change the set points for Night Light:
1. Press <SET> to advance to the set point screens <HYST>, <VOLT>, and <TIME>.
2. Press <←> or <→> to increase or decrease the values.
3. Press <BACK> to return to the ERROR OUTPUT set point screen.
4. Press <EXIT> to return to the AUX Mode screen.

To Exit:
- Press <EXIT> once to return to the main menu.
- Press <EXIT> twice to return to the status screen.

Adjusts the amount of time the night light remains on.
Adjusts the threshold of the voltage that triggers the function.

Figure 23 Setting the Night Light Mode
Float (AUX Mode)

This mode is intended to operate a load when the FLEXmax is in the Float stage of charging the batteries.

To set the mode for Float:

1. From the Main Menu, press <←> or <→> to move the → to the left of Aux.
2. Press <GO> to open the AUX MODE screen.
3. Press <NEXT> until Float is displayed in the AUX MODE screen.
4. Press <MODE> to cycle through the mode set points ON, OFF, or AUTO.
   - ON activates the Aux output.
   - OFF deactivates the Aux output.
   - AUTO controls the output according to the criteria of the selected Aux mode.

To Exit:

- Press <EXIT> once to return to the main menu.
- Press <EXIT> twice to return to the status screen.

Figure 24 Setting the Float Mode
Diversion (AUX Mode)

When external DC sources (wind, hydroelectric) are directly connected to a battery bank, any excess power should be sent to a diversion load, such as a heating element, using a mechanical relay or solid-state relay.

In Diversion mode, the user programs set points — from –5.0 volts to 5.0 volts relative to the Absorbing, Float, and EQ voltages — to activate the AUX output. The Diversion AUX mode can be active (ON) when the battery voltage is raised above one of these set points for a certain amount of time or inactive (OFF) when it falls below.

- To control a mechanical relay for basic on/off switching of a standard diversion load, follow the instructions in Figure 25 (both pages).
- To control a solid-state relay for PWM switching and precise control of a load, follow the instructions in Figure 26 (both pages). This application should not be used with a mechanical relay. It requires the use of a resistive load and should not be used with other sorts of loads.

For a wiring diagram illustrating how to connect this function, see Figure 27.

Diversion:Relay Mode

**Important:**
If using wind or hydroelectric turbines, keep the charge controller’s diversion voltage slightly above the Absorbing and Float voltage settings for efficient functioning.

To set the mode for Diversion:Relay:

1. From the main menu, press << > or >> to move the ▶ to the left of Aux.
2. Press <GO> to open the AUX MODE screen.
3. Press <NEXT> until Diversion:Relay is displayed in the AUX MODE screen.
4. Press <MODE> to cycle through the mode set points ON, OFF, or AUTO.
   - **ON** activates the Aux output.
   - **OFF** deactivates the Aux output.
   - **AUTO** controls the output according to the criteria of the selected Aux mode.

Continued on next page....

Figure 25 Setting the Diversion:Relay AUX Mode (Part 1)
To change the set points for Diversion:Relay:

1. Press <SET> to advance to the set point screens <VOLT> and <TIME>.
2. Press <TIME> to advance to the Time screen. This allows the user to adjust the minimum time the Aux output is active after the battery voltage falls below the hysteresis voltage.
3. Press <-> or <+> to increase or decrease the Hold time values.
4. Press <DLY+> to increase the Delay Time.
5. Press <BACK> to return to the Diversion:Relay TIME and VOLT screen.
6. Press <VOLT> to move into the Relative Volts screen.
7. Press <-> or <+> to increase or decrease the values.
8. Press <HYST> to select the hysteresis value.
9. Press <BACK> to return to the main Diversion:Relay TIME and VOLT screen.
10. From the Diversion:Relay screen, press <EXIT> to return to the AUX MODE screen.

**Hold** time shows how long the Aux output stays active after the battery voltage has fallen below the HYST (hysteresis) set point. The user can adjust the Hold time from 0.1 to 25 seconds.

The Delay time shows how long the battery voltage must be above the Relative Volts before the Aux mode is activated. It can be adjusted from 0 to 24 seconds, but is rarely required.

Pressing the <BACK> soft key returns to the AUX MODE Diversion: Relay TIME and VOLT screen.

Use this screen to establish the set points for starting and ending the Aux mode relative to the Absorb, Float, and EQ voltages.

The <HYST> (hysteresis) set point establishes when the Aux mode becomes inactive after the battery voltage falls below the Relative Volts voltage minus the hysteresis value.

---

**Figure 25** Setting the Diversion:Relay Mode (Part 2)
Diversion: Solid St (AUX Mode)

**IMPORTANT:**
- If using wind or hydroelectric turbines, keep the charge controller’s diversion voltage slightly above its Absorb and Float voltage settings for efficient functioning.
- Do not use **Diversion: Solid St** with a mechanical relay. The PWM action could cause irregular relay activity.
- **Diversion: Solid St** requires the use of a purely resistive load. The PWM action may work poorly with mechanical loads.

To set the mode for **Diversion: Solid St**:

1. From the main menu, press ← or → to move the → to the left of Aux.
2. Press <GO> to open the **AUX MODE** screen.
3. Press <NEXT> until the **Diversion: Solid St** mode is displayed in the **AUX MODE** screen.
4. Press <MODE> to cycle through **ON**, **OFF**, or **AUTO**.
   - **ON** activates the Aux output.
   - **OFF** deactivates the Aux output.
   - **AUTO** controls the output according to the criteria of the selected Aux mode.

*Continued on next page...*
Operation

To change the set points for Diversion:Solid St:

1. Press <SET> to advance to the set point screens <VOLT> and <TIME>.
2. Press <TIME> to advance to the Time screen. This allows the user to adjust the minimum time the Aux output is active after the battery voltage falls below the hysteresis voltage.
3. Press <-> or <--> to increase or decrease the Hold time values.
4. Press <DLY-> to increase the Delay time.
5. Press <BACK> to return to the Diversion:Solid St TIME and VOLT screen.
6. Press <VOLT> to move into the Relative Volts screen.
7. Press <-> or <--> to increase or decrease the values.
8. Press <HYST> to select the hysteresis value.
10. From the Diversion:Solid St screen, press <EXIT> to return to the AUX MODE screen.

To Exit:
- Press <EXIT> once to return to the main menu.
- Press <EXIT> twice to return to the status screen.

Hold time shows how long the Aux mode stays active after the battery voltage has fallen below the HYST (Hysteresis) set point. The user can adjust the Hold time from 0.1 to 25 seconds.

The Delay Time shows how long the battery voltage must be above the Relative Volts before the Aux mode is activated. It can be adjusted from 0 to 24 seconds, but is rarely required.

Use this screen to establish the set points for starting and ending the Aux mode relative to the Absorb, Float, and EQ voltages.

The <HYST> (hysteresis) set point establishes when the Aux mode becomes inactive after the battery voltage falls below the Relative Volts voltage minus the HYST value.

Figure 26  Setting the Diversion:Solid St Mode (Part 2)
Figure 27  Wiring Diagram for Diversion Load and AUX Wiring
Low Battery Disconnect (AUX Mode)

This mode disconnects “auxiliary” loads from the batteries in the event of low voltage. These are separate from the usual loads. Auxiliary loads are controlled by the Aux output, usually by a larger relay. When the battery voltage falls below DISCONNECT VOLTS setting, Aux loads are disconnected. When it rises above RE-CONNECT VOLTS, they will be reconnected.

Any loads not controlled this way, such as an inverter, may continue discharging the battery.

To set the mode for Low Battery Disconnect in Aux mode:

1. From the main menu, press < or > to move the ➔ to the left of the Aux.
2. Press <GO> to open the AUX MODE screen.
3. Press <NEXT> until the Low Batt Disconnect Mode is displayed in the AUX MODE screen.
4. Press <MODE> to cycle through the mode set points; ON, OFF, or AUTO.
   - ON activates the Aux output.
   - OFF deactivates the Aux output.
   - AUTO controls the output according to the criteria of the selected Aux mode.

To change the set points for Low Battery Disconnect:

1. Press <SET> to advance to the set point screens <VOLT> and <TIME>.
2. Press <TIME> to advance to the Delay Time Sec screen.
3. Press <—> or <+> to increase or decrease the values.
4. Press <BACK> to return to the main Low Batt Disconnect screen.
5. Press <VOLT> to advance to the DISCONNECT VOLTS screen.
6. Press <—> or <+> to increase or decrease the values.
7. Press <RECON> to advance to the RE-CONNECT VOLTS screen.
8. Press <—> or <+> to increase or decrease the values.
9. Press <DisV> to return to the DISCONNECT VOLTS screen.
10. Press <BACK> to return to the Low Batt Disconnect screen.

To Exit:

- Press <EXIT> once to return to the main menu.
- Press <EXIT> twice to return to the status screen.

**Figure 28 Low Battery Disconnect Mode**
Remote (AUX Mode)

Remote allows an OutBack system display to control the charge controller’s AUX output. Some displays may require a certain level of software in order to use this feature. Consult the owner’s manual for the system display being used for details.

To set the mode for Remote:
1. From the main menu, press << or >> to move the → to the left of the Aux.
2. Press <GO> to open the AUX MODE screen.
3. Press <NEXT> until the Remote mode is displayed in the AUX MODE screen.
4. Press <MODE> to cycle through ON, OFF, or AUTO.
   o ON activates the Aux output.
   o OFF deactivates the Aux output.
   o AUTO controls the output according to the criteria of the selected Aux mode. This setting may be required depending on the type of system display being used.

To Exit:
   o Press <EXIT> once to return to the main menu.
   o Press <EXIT> twice to return to the status screen.

The Aux output can be used for the AGS (Advanced Generator Start) function of a system display. Remote must be activated for this to work. The system display must be set to the HUB port used by the FLEXmax. If using a MATE-class system display, see page 83 of this book. If using the MATE3-class, see page 69. See the product literature for more information.

Backlight

The Backlight selection allows the LCD and soft keys to remain illuminated for up to nine minutes whenever any soft key is pressed. The default setting for this mode is AUTO. Pressing any soft key when the LCD is not illuminated does not change any settings.

To set the mode for Backlight:
1. From the main menu, press << or >> to move the → to the left of Light.
2. Press <GO> to open the Backlight Control screen.
3. Press <MODE> to cycle through ON, OFF, or AUTO.
   o ON activates the backlight.
   o OFF deactivates the backlight.
   o AUTO activates the backlight on a timer.
4. Press <<- or <-> to increase or decrease the number of minutes (up to 9) for the Auto Time mode.
5. Press <EXIT> twice to return to the status screen.

To Exit:
   o Press <EXIT> once to return to the main menu.
   o Press <EXIT> twice to return to the status screen.
EQ – Battery Equalize

Equalization is a controlled overcharge that is part of regular battery maintenance. Equalization brings the batteries to a much higher voltage than usual and “simmers” them for a period of time. This has the result of removing inert compounds from the battery plates and reducing stratification in the electrolyte. Equalization follows the same pattern as standard three-stage charging. However, instead of the Absorption voltage set points, it is controlled by the Battery Equalize Volts settings. The time is controlled by the Battery Equalize Time setting.

Equalization is normally performed only on flooded lead-acid batteries. The schedule for equalization varies with battery use and type, but it is usually performed every few months. If performed correctly, this process can extend battery life by a considerable amount.

---

**CAUTION: Battery Damage**

- Do not equalize any sealed battery types (VRLA, AGM, Gel, or other) unless approved by the manufacturer. Some batteries may suffer severe damage from equalization.
- Contact the battery manufacturer for recommendations on equalization voltage, duration, schedule, and/or advisability. Always follow manufacturer recommendations for equalization.

---

To change the EQ mode settings:

1. From the main menu, press < or > to move the ➔ to the left of EQ.
2. Press <GO> to open the BATTERY EQUALIZE Volts screen.
3. Press <EQV> to decrease the value.
4. Press <+EQV> to increase the value.
5. Press <NEXT> to advance to the Battery Equalize Time screen.
6. Press <HRS> to decrease the value.
7. Press <+HRS> to increase the value.
8. Press <NEXT> to advance to the Battery Equalize Start screen.
9. Choose one of the following equalization modes:
   - Press <START> to start a manual equalization charge.
   - Press <STOP> to stop an equalization charge.
   - Press <AUTO> to view the auto equalization screen. See Figure 32 for details.

To Exit:

- Press <EXIT> once to return to the main menu.
- Press <EXIT> twice to return to the status screen.

---

Figure 31 Using Equalization
Automatic Equalization Mode

To enable an automatic equalization mode, an interval must be set for the number of days to pass between equalization cycles. This interval can be between 1 to 250 days. The default equalization interval setting is 000 which disables this feature.

The Equalization Interval screen allows the user to set the interval between equalization cycles. It also displays how many days of the interval has passed. The COUNT value will be cleared to 000 when an equalization cycle is started, manually stopped, or if the charge controller has been powered off.

To enable an automatic EQ cycle:

1. Press <AUTO> to display the equalization interval screen.
2. Use <-DAY> or <+DAY> to set the number of days between each equalization cycle.
3. Press <BACK> to return to the status screen.

To Exit:
- Press <EXIT> once to return to the EQ screen.

On the Status Screen:
- EQ-MPPT will display to indicate the FLEXmax is trying to reach the target equalize set point.
- EQ 0:00 in Hours:Minutes will display after the set point is reached.
- After recharging, an EQ DONE message displays and a Float cycle begins. EQ DONE is displayed until (1) any soft key is pressed, or (2) a new day occurs for systems using an OutBack system display.

The incomplete equalization cycle continues into the next day unless the FLEXmax is powered off or manually stopped. The remaining EQ time can be viewed in the End-of-day Summary screen (see page 20).

EQ cycle terminates when the equalization time period is reached.
Misc Screen

There are three Misc screens that provide technical information about the operating state of the system. These are read-only screens and allow for no changes to any of the settings. They do provide the means to wake up the charge controller if it is in Snooze mode. They also provide a means to force the charger into a Bulk or Float stage.

To access the Misc screens:
1. From the Main Menu, press <leftrightarrow> or <leftrightarrow> to move the ➔ to the left of the Misc function.
2. Press <GO> to open the Misc screen.

Press <EXIT> to return to the Main Menu.

A number below GT means the FLEXmax is in grid-tie mode and communicating with an OutBack grid-interactive inverter. These numbers are for engineering purposes and are not significant in normal use. If the inverter is not grid-interactive, then this number will read 000. (See pages 51 and 104.)

Each MPPT operation has a state which is indicated by a number. These numbers are for engineering purposes and are not significant in normal use.

This indicates the percentage of "on" time for the FETs as they are performing pulse width modulation.

The charge timer (ChgT) counts up to the Absorb time limit when the charger is in the Absorb stage. See pages 22 and 52.

Press <NEXT> to continue to the Force Bulk/Float screen.

Figure 33 Miscellaneous Screen #1
To bring the charge controller out of Snoozing mode:
1. Press <RSTRT>.
2. Press <EXIT> to return to the main menu.

To force the charger into a Bulk or Float charge cycle:
1. Press <NEXT>.
2. Select either a Float or Bulk charge cycle. Forcing a Float or Bulk recharge will end an EQ cycle. See page 22 for details on these modes.
   - Press <FLOAT> to force a Float charge.
   - Press <BULK> to force a Bulk charge.
3. Press <EXIT> to return to the main menu, or press <NEXT> to view the next miscellaneous screen.

**Misc Screen #2**

- **PCB**: represents the temperature of the internal components. It is used to control the cooling fan. These values are in digital counts, not degrees. The lower the number, the higher the temperature. (25°C is approximately a value of 525.)

- **BTMP**: is a battery temperature sensor reference value, used to compensate the charging voltage. The range is 0 to 255. These values are in digital counts, not degrees. An X next to this value indicates an external RTS is being used in a system with a HUB and system display.

- **CFB**: represents Current FeedBack. This is the output value of the internal current sensor and is used to calculate output amps and watts to track the maximum power point of the array.

**Figure 34 Miscellaneous Screen #2**
Advanced Menu

The Advanced menu allows fine-tuning of the FLEXmax operations including Snooze periods and Maximum Power Point limits (see page 97). The following modes are available in the Advanced menu. They will appear in the following order.

- Snooze Mode
- Wakeup
- MPPT Mode
- Park Mpp
- Mpp Range Limit % Voc
- Absorb Time
- Rebulk Voltage
- Vbatt Calibration
- RTS Compensation
- Auto Restart
- Aux Polarity
- Reset to Defaults?

To Access the Advanced Menus:
1. From the main menu, press <←> or <→> to move the → to the left of Advanced.
2. Press <GO> to open the first Advanced menu screen.
3. Press <NEXT> to cycle through the available modes. The Snooze Mode screen should be the first screen to display.
4. Press <EXIT> to return to the status screen.

Snooze Mode (Advanced Menu)

Snoozing occurs if the charging current does not reach the user-selected cutoff current set point as shown in this screen.

To adjust the set point in the Snooze Mode screen:
1. Navigate to the Snooze Mode screen through the ADVANCED MENU as instructed in Figure 35.
2. Press <AMP> to adjust the amp setting.
   Amp values increments include: 0.2, 0.4, 0.6, 0.8 and 1.0.
3. Press <NEXT> to advance to the Wakeup Mode screen.

To Exit:
- Press <EXIT> once to return to the main menu.
- Press <EXIT> twice to return to the status screen.
Wakeup Mode (Advanced Menu)

Wakeup Mode sets the open-circuit voltage ($V_{oc}$) conditions that cause the charge controller to wake up during Sleep and Snooze modes. Since environmental conditions impact the open-circuit voltage of an array, the $V_{oc}$ can be based on the last measured $V_{oc}$ value.

Before changing these values, monitor the system for a week or so using the factory defaults and then gradually adjust the set points. If the set points are set too high, the charge controller might not wake up soon enough or often enough, which means a loss of power production.

To adjust the set points in Wakeup Mode:
1. Navigate to the Wakeup Mode screen through the ADVANCED MENU as instructed in Figure 35.
2. Press <AMP> to adjust the amp setting. Amp values increment include: 0.2, 0.4, 0.6, 0.8 and 1.0.
3. Press <NEXT> for the voltage settings screen.
4. Press <+VOC> or <-Min> to adjust the voltage and delay settings.
   - <+VOC> ranges from 1.5 V up to 9.5 V
   - <-Min> ranges from 5 up to 15 minutes
5. Press <NEXT> for the MPPT Mode screen.

To Exit:
- Press <EXIT> once to return to the main menu.
- Press <EXIT> twice to return to the status screen.

MPPT Mode (Advanced Menu)

This screen allows the user to choose from the following modes:
- Auto Track MPPT mode (default) automatically tracks the PV upon wakeup and then tracks the MPP of the array. If Auto Restart is set to 1 or 2, the charge controller awakes every 1.5 hours and does an initial tracking. (See page 55.)
- U-Pick % ($V_{oc}$) MPPT mode allows the user to manually adjust the MPP tracking limit as a percentage of the array’s open-circuit voltage ($V_{oc}$). This percentage is displayed in the Park Mpp% $V_{oc}$ screen along with the current output wattage. (See page 51.) The wattage value changes as the user adjusts the $V_{oc}$ percentage, letting the user lock in the most advantageous percentage value. U-Pick % acquires a new $V_{oc}$ value every 1.5 hours if Auto Restart is set to 1 or 2.

To select the MPPT Mode:
1. Navigate to the MPPT Mode screen through the ADVANCED MENU as instructed in Figure 35.
2. Press <MODE> to choose an MPPT mode. If the system has an OutBack grid-interactive inverter with a HUB and system display, press <nonGT> to change it to <GT>. This will place the controllers in GT mode to allow the inverter to sell excess power.
3. Press <NEXT> to view the Park Mpp screen.

To Exit:
- Press <EXIT> once to return to the main menu.
- Press <EXIT> twice to return to the status screen.
Operation

- **GT** allows the FLEXmax to work more effectively with a grid-interactive OutBack inverter. This setting automatically raises the charge controller’s Float voltage to equal its Absorption voltage. Since the inverter sells power to maintain its own Float, Absorption, or Sell settings (all of which should be lower than those of the controller), this mode makes it easier for the inverter to sell power. (See pages 47 and 104 for more information on this mode.)

**NOTE:** The charge controller’s Float voltage returns to normal any time the inverter enters PassThru or Silent modes. (See the inverter Operator’s Manual for inverter modes.)

- The **Park Mpp** screen will be slightly different between Auto Track mode and U-pick mode. In the U-pick mode, the Watts will appear in addition to the %Voc value.

---

**Figure 39 MPPT Mode – U-Pick %**

---

The **Mpp Range Limit % Voc** adjusts the upper range limit of the FLEXmax charge controller’s maximum power point (MPP) tracking.

The default **Max** MPP voltage limit is set at 90% of the Voc and is normally not adjusted for a PV array. If necessary, the adjustable limits are 80%, 85%, 90%, and 99% of the Voc.

**Min** optimizes the tracking window for MPPT. The default **Min** setting of 1/2 establishes the lower limit of this window as one-half the Voc.

The **Min** range limit setting may be set to **FULL** if something other than a PV array is connected to the input of the FLEXmax, such as a hydroelectric turbine (see page 102). However, the input voltage must never exceed 150 Vdc at any time.
**Absorb Time Limits (Advanced Menu)**

The amount of time the charge controller stays in the Absorbing stage of charging can be adjusted in the *Absorb Time Limits* screen. An Absorbing charge stage normally ends when the battery voltage is maintained at the Absorbing set point for the time period set in the *Absorb Time Limits* screen.

- Absorb Time is adjustable from 0 to 24 hours (consult the battery manufacturer’s recommendations).
- When the Absorb Time Limit is reached, the charge controller goes into Float stage and may briefly display *Charged*, then *Float*. When the battery voltage drops below the *Float* voltage set point, the charge controller recharges to maintain this set point, employing the MPPT function in *MPPT Float* mode.

**To adjust the set points in the *Absorb Time Limits* screen:**

1. Navigate to the *Absorb Time Limits* screen through the *ADVANCED MENU* as instructed in Figure 35.
2. Use < → > or < → > to adjust the Absorb time from 0.0 to 24.0 hours following the recommendation of the battery manufacturer.
3. Press <NEXT> to advance to the *Absorb End Amps* screen.

**To Exit:**

- Press <EXIT> once to return to the main menu.
- Press <EXIT> twice to return to the status screen.

*Figure 40 Absorb Time Limits Screen*

---

**Absorb End Amps (Advanced Menu)**

While the battery voltage is at or above the Absorbing voltage target (see page 22) and the *Absorb End Amps* value is reached for a time delay of 15 seconds, the charge controller will switch to the Float stage. This happens regardless of the charger time minutes as shown in the *Misc* menu under *ChgT* (see page 47). The charger timer will be reset to zero.

**To adjust the set points in the *Absorb End Amps* screen:**

1. Navigate to the *Absorb End Amps* screen through the *ADVANCED MENU* as instructed in Figure 35.
2. Use < → > or < → > to adjust the amperage limit following the recommendation of the battery manufacturer. The default value is 00.
3. Press <NEXT> to advance to the *Rebulk Voltage* screen.

**To Exit:**

- Press <EXIT> once to return to the main menu.
- Press <EXIT> twice to return to the status screen.

*Figure 41 Absorb End Amps Screen*
Rebulk Voltage (Advanced Menu)

In the *Float* stage, if the battery voltage falls below the *ReBulk Voltage* set point for at least 90 seconds, the FLEXmax will automatically initiate a new charge cycle.

To adjust the set points in the *Rebulk Voltage* screen:
1. Navigate to the *Rebulk Voltage* screen through the *ADVANCED MENU* as instructed in Figure 35.
2. Use < - > or < + > to adjust the voltage limit following the recommendation of the battery manufacturer. The default values are 12.0 V, 24.0 V, 36.0 V, 48.0 V and 60.0 V.
3. Press <NEXT> to advance to the *Vbatt Calibration* screen.

To Exit:
- Press <EXIT> once to return to the main menu.
- Press <EXIT> twice to return to the status screen.

Figure 42 Rebulk Voltage

Vbatt Calibration (Advanced Menu)

A quality, calibrated voltmeter will provide even more accurate FLEXmax battery readings if an undesirable voltage drop occurs. When measuring battery voltage, ensure a good connection is made to the four wire lugs. Check the battery temperature compensation voltages if the voltages are much different than expected from the charger setup *Absorbing* and *Float* voltage settings.

To adjust the set points in the *Vbatt Calibration* screen:
1. Navigate to the *Vbatt Calibration* screen through the *ADVANCED MENU* as instructed in Figure 35.
2. Use < - > or < + > to increase or decrease the value. The voltage will change in increments of 0.1 Vdc.
3. Press <NEXT> to advance to the *Rebulk Voltage* screen.

To Exit:
- Press <EXIT> once to return to the main menu.
- Press <EXIT> twice to return to the status screen.

Figure 43 Vbatt Calibration

**RTS Compensation (Advanced Menu)**

The *RTS Compensation* screen allows the user to control the Absorbing and Float voltage limits during charging when using a Remote Temperature Sensor (RTS). The RTS adjusts charging voltage depending on battery temperature. (See page 99 for the amount of compensation per degree.) However, some conditions can make compensation less than optimal, such as extreme weather (hot or cold), or charging restrictions from the battery manufacturer. Therefore, the *RTS Compensation* screen allows the user to control the limits used by the compensation feature.
For example:

- During cold weather, a battery often requires a higher charging voltage. Some inverters might not accommodate these voltages and can shut down during charging, cutting off power to their loads.
- During hot weather, limiting the **RTS Compensation** values assures the voltage stays high enough to charge the batteries instead of dropping too low in reaction to a higher ambient temperature.
- Battery manufacturer specifications indicate not to exceed a certain voltage or battery damage could occur.

In all cases, the batteries should be monitored to ensure they are being charged according to the battery manufacturer’s recommendations.

**RTS Compensation** has two options available.

- **WIDE** allows the RTS full control over charging. This option uses the default values for the RTS.
- **LIMIT** sets the minimum and maximum voltages for the RTS.

Pressing the soft key below each option switches between the two options. When the **LIMIT** option is visible, a `<SET>` soft key is available to advance to a screen that allows the user to adjust the settings.

---

**To use the default **RTS Compensation** values:**

1. Navigate to the **RTS Compensation** screen through the **ADVANCED MENU** as instructed in Figure 35.
2. If **WIDE** is visible above the soft key, the absorb and float values shown in this screen will be used by the system.

**To Exit:**

- Press `<NEXT>` to advance to the **Auto ReStart** menu.
- Press `<EXIT>` once to return to the main menu.
- Press `<EXIT>` twice to return to the status screen.

**To limit the **RTS Compensation** values:**

1. Navigate to the **RTS Compensation** screen through the **ADVANCED MENU** as instructed in Figure 35.
2. If **WIDE** is visible above the soft key, press the `<WIDE>` soft key to change the display to show **LIMIT**.
3. Press `<SET>` to advance to the **RTS COMPENSATION** limits screen.
   - Press `<→>` until the `<→>` is next to the limit to be changed. The `<→>` will switch between the upper and lower limit values each time it is pressed.
   - Press `<→>` to decrease the value.
   - Press `<→>` to increase the value.

**To Exit:**

- Press `<BACK>` to return to the main **RTS Compensation** screen.
- Press `<EXIT>` once to return to the main menu.
- Press `<EXIT>` twice to return to the status screen.

---

**Figure 44**  **RTS Compensation**
Auto ReStart (Advanced Menu)

This setting allows the user to choose between continuous maximum power point (MPP) tracking, or occasional restarts of the sweeping process. A restart means the controller abandons the existing maximum power point value it was using and “re-sweeps”, or begins gathering new power point data. (See page 97 for more information on MPP tracking.)

Auto ReStart has three options available:

- **Mode 0** – Initial sweep only and then continuous MPP tracking. Auto ReStart is disabled. The FLEXmax will continuously track the maximum power point without starting over.
- **Mode 1** – Automatic re-sweep every 90 minutes if controller is in an MPPT mode (MPPT Float, MPPT Bulk, etc). This will not reset any counters, charging stages, or statistics.
- **Mode 2** – Automatic re-sweep every 90 minutes if controller is in any charging mode. This will not reset any counters, charging stages, or statistics.

**Figure 45 Auto ReStart**

To select an Auto ReStart mode:

1. Navigate to the Auto ReStart screen through the ADVANCED MENU as instructed in Figure 35.

2. Press <MODE> to switch between the three Auto ReStart modes: MODE 0 (default), MODE1, and MODE2.

To Exit:

- Press <NEXT> to advance to the Aux Polarity screen.
- Press <EXIT> once to return to the main menu.
- Press <EXIT> twice to return to the status screen.

Figure 45  Auto ReStart
Aux Polarity (Advanced Menu)

When the Aux function is ON, 12 volts DC is present at the Aux terminals (Active High). When the Aux function is OFF, 0 volts DC are present at the terminals (Active Low).

Aux Polarity allows the user to reverse the availability of this voltage for the Night Light, PV Trigger, or Diversion Relay functions. When one of these functions has been chosen as the Aux function, an arrow in the right hand corner of the screen will reflect the Aux Polarity state.

- In Active High, the user establishes certain conditions for these functions.
- In the Active Low, zero voltage will be available for a function that in Active High would normally have voltage.

To select the mode for Aux Polarity:
1. Navigate to the Aux Polarity screen through the ADVANCED MENU as instructed in Figure 35.
2. Press <MODE> to switch between:
   - Active High or Active Low

To Exit:
- Press <NEXT> to advance the Reset to Defaults? screen.
- Press <EXIT> once to return to the main menu.
- Press <EXIT> twice to return to the status screen.

Reset to Defaults?

To exit the Reset to Defaults menu without resetting the charge controller:
- Press <EXIT> to return to the main menu.
- Press <EXIT> again to return to the status screen.

This will exit the menu without making any changes to the current settings.

To reset the FLEXmax to factory default settings:
1. Press <RESET>.
2. Press <YES> to confirm the reset. Upon the next power-up, the FLEXmax will prompt the user to confirm the voltage (see page 18).
3. Press <EXIT> twice to return to the main menu.
4. Press <NEXT> to return to the beginning of the ADVANCED MENU (see page 49).

This procedure is recommended any time the controller is relocated or the system is substantially revised. The settings can also be reset to the defaults by performing a reboot (see page 60).
Logging

The Logging screen in the main menu enables the user to clear the daily and cumulative logs if necessary. Logs can be downloaded to an SD card if a MATE3 or MATE3s is installed. See page 71 for details.

The FLEXmax daily log begins when the controller enters Wakeup. See page 26.

---

**IMPORTANT:**
If two or more charge controllers are used in the same system and are started up or cleared on different days, their numeric dates will not be the same. This can lead to some misunderstandings when looking back and comparing data between the two or more units. A user looking back at day 12 on both units would find very different results.

---

**To clear the logs:**

1. From the main menu, press \(<\) to move the arrow next to Logging.

2. Press \(<GO>\) to advance to the End-of-the-Day summary screen.

3. Press the second soft key (SK2) to bring up the CLEAR Log screen. The CLEAR LOG screen offers the option of clearing up to 128 days of accumulated statistics or the total in the secondary STATS screen (page 59).

4. Press and hold either \(<TOTL>\) (total) or \(<DAILY>\) to clear those specific statistics. The Are you sure? screen appears.

5. Pressing \(<YES>\) returns to the CLEAR LOG screen; pressing \(<NO>\) returns to the Logging screen.

6. Press \(<BACK>\) to return to the End-of-Day summary screen.

Pressing SK3 and SK4 changes the displayed day’s statistics, by moving either forward or backward within the 128 days of available statistics that are viewable.

---

Figure 48 Logging Mode
Stats

The STATS screen in the main menu displays additional voltage and time information. In a stand-alone FLEXmax controller — one that is not connected to a system display — Sunrise shows how long ago the FLEXmax woke up for the first time each day and when the daily and total logged values were updated and cleared. If the FLEXmax is connected to a system display, the logging occurs at midnight.

To view the STATS screen:
1. From the main menu, press <=> to move the arrow next to STATS.
2. Press <GO> to advance to the statistics screens.

Press <NEXT> to view the second STATS screen.

Figure 49  STATS Mode
The **Secondary Stats** screen shows the total accumulated DC and AC kilowatt-hours and kiloamp-hours of the charge controller.

Pressing the `<DckWH>` soft key switches the screen between DC kilowatt-hours and AC kilowatt-hours.

- **DckWH** shows the DC kilowatt-hours and should be used in a system that is not grid-interactive.
- **ACKWH** is used with a grid-interactive system. This measure is based on a 90% inverter efficiency (1 kWh DC = 0.9 kWh AC).

Pressing the `<BACK>` key three times returns to the main menu.

---

**Extended Play Mode**

If the MPP voltage is low enough to approach the battery voltage (usually when the PV array is very hot), it is near the effective limit of the MPPT function. Side effects may cause the FLEXmax components to make a squealing noise. Extended Play mode alleviates this problem by extending the parameters of the MPPT sweep.

**To activate or deactivate the Extended Play feature:**

Follow the instructions in Figure 51 for reaching the **Revision** screen.

While continuing to hold **SK1**, press and hold **SK3**. After a few seconds, the screen will toggle the status of Extended Play and display it.

- **X on** means the mode is on.
- If necessary, continue to press and hold **SK3** until it reads **X on**.

To deactivate, repeat the process until the screen reads **X off**.

---

**Viewing the Firmware Revision**

The current firmware revision of the FLEXmax controller can be viewed on its own screen.
Rebooting the FLEXmax

If the screen becomes garbled or the FLEXmax controller otherwise will not respond to commands, it may be necessary to reboot its internal processor.

---

**IMPORTANT:**
Rebooting the FLEXmax controller will return all the values and set points to the factory defaults. These values are listed on page 96. It is advisable to record all custom values before rebooting.

---

**To reboot the FLEXmax:**

1. Turn off the battery and PV array circuit breakers. The FLEXmax should have no sources of power connected. Observe the screen until it goes blank.

2. Press and hold the first and third soft keys (SK1 and SK3).

3. While holding down these soft keys, switch on the battery circuit breaker.

This process follows the power-up sequence shown on page 17. Continue to follow the *Select Version* screen instructions from the beginning of the manual.

---

*Figure 53  Rebooting the FLEXmax*
MATE3-class System Display and Controller

This section covers the use of both the MATE3 and MATE3s products. A MATE3-class system display provides the means for programming the FLEXmax charge controller and other devices when preprogrammed default settings do not work for the destined installation.

Display and LED Status Indicators

![Display and LED Status Indicators](image)

*Figure 54 Display and LED Status Indicators*
Charge Controller Soft Key

Press this soft key to view FLEXmax charge controller status information. If no charge controller is present, the PV icon will be blank and this soft key will be inoperative.

Charge Controller Modes:
- Bulk
- Absorb
- Float
- EQ
- Silent

The FLEXmax has over 25 modes. The system display can only display five status messages and may substitute one of the five for a FLEXmax mode not on this list. Check the FLEXmax status screen to determine its exact mode.
- See page 22 for a description of modes.
- See page 98 for a description of battery charging.

Soft Keys:
- <Datalog> brings up a group of charge controller statistics that are maintained as a continuous daily log. These screens are all shown beginning on page 63.
- <Graph> brings up a series of screens that plot various charge controller information over time. The graphs include inverter and charger wattage, power imported from an AC source, battery voltage, and others. These screens are all shown beginning on page 64.
- <Port> cycles through each device connected to the network. If more than one charge controller is installed in the system, pressing the <Port> soft key will cycle through each controller.
- <Back> returns to the previous screen.

Screen Items:
The upper left corner of the screen shows the FLEXmax charge controller’s current mode of operation. **Bulk** is shown in this illustration.
- **In** displays the present PV array operating voltage and the current being harvested from the array.
- **VOC** displays the open-circuit voltage available from the PV.
- **Out** displays the present battery voltage and the current being delivered from the charge controller(s) to charge the battery bank. To the right, this line displays the number of kilowatt-hours and amp-hours accumulated that day.
- **Operating** displays the total hours the charger has operated that day in any stage.
- **Float** displays the run time of the Float timer when in the Float stage.
- **Absorb** displays the run time of the timer when in the Absorbing stage.
- **Maximum** displays the maximum amperage and wattage harvested from the PV array that day, and the time both were recorded.

The lower right corner shows the current status of the charge controller’s Auxiliary (Aux) output. (See page 68.)
DataLog Screen

The <DataLog> soft key shows accumulated daily amp-hour and watt-hour statistics, as well as maximum current, wattage, and maximum and minimum voltage figures. These maintain a continuous daily log, up to 128 days, which can be recalled. One day can be displayed at a time. See page 58 for more information.

Screen Items:

The upper left corner shows the date of the selected Datalog screen. (The current Datalog screen reads “Today.”) To the right, this line also displays the kilowatt-hours and amp-hours accumulated that day.

Max Output displays the maximum current and wattage recorded that day.

Absorb The amount of time the Absorbing timer ran that day.

Float The amount of time the Float timer ran that day.

High VOC displays the highest open-circuit voltage (Voc) recorded that day.

Min Batt displays the lowest battery voltage recorded that day.

Max Batt displays the highest battery voltage recorded that day.

Soft Keys:

<Day> advances the display forward by a single day. If the display reads “Today”, it does nothing.

<Day> advances the display backward by a single day and will display the selected date.

<Back> returns to the previous screen.

<Port> cycles through each device connected to the network.
Graph Screens

The `<Graph>` soft key brings up the following screens which plot various type of data over time. The first screen shows changes in PV wattage over time.

![Output Graph](image)

**Figure 57 Output Graph**

The `<Next>` soft key brings up a screen showing changes in battery voltage over time.

![Battery Graph](image)

**Figure 58 Battery Graph**

The `<Next>` soft key brings up a screen showing changes in PV voltage over time.

![PV Graph](image)

**Figure 59 PV Graph**

Continuing to press the `<Next>` soft key will proceed through the same graphs again from the beginning.
Figure 60 shows the menu structure for adjusting the FLEXmax charge controller settings.

The **Main Menu** shown above is accessed with the **LOCK** button and a password. Use the control wheel on the system display to move up and down between menus (or options within a menu). Use the center button on the control wheel to make a selection. (See the system display literature for more information.)

Some menus may not be accessible if the user access levels are restricted.
Charge Controller Settings

Charge Controller menu options include the following:

- **Charger** ........................................... > See below.
- **MPPT** ............................................ > See below.
- **Temperature Compensation** ............... > See page 67.
- **Battery Equalize** ............................. > See page 67.
- **Grid-Tie Mode** ................................. > See page 67.
- **Auxiliary Output** ............................ > See page 68.
- **Restart Mode** ................................ > See page 69.
- **Calibrate** ....................................... > See page 70.
- **Reset Charge Controller to Factory Defaults** --- > See page 70.

**Charger**

**IMPORTANT:**

Battery charger settings need to be correct for a given battery type. Always follow battery manufacturer recommendations. Making incorrect settings, or leaving them at factory default settings, may cause the batteries to be undercharged or overcharged.

The charge controller uses a “three-stage” battery charging cycle which utilizes multiple settings. This menu controls the voltages and timers for the battery charger. See page 98 for an explanation of the three-stage cycle and a description of the individual stages.

**MPPT**

The charge controller uses a maximum power point tracking (MPPT) algorithm which manipulates the output of the PV array to harvest maximum wattage. Although this function is automatic, this menu allows the user to adjust many of its parameters for special applications. See pages 50, 51, and 102.
Temperature Compensation

When equipped with the Remote Temperature Sensor (RTS), the charge controller compensates for temperature changes by raising or lowering its charging voltages. However, in some cases the sensitivity of other DC devices may require this temperature compensation to be limited. This menu allows the user to manually adjust the upper and lower limits of temperature compensation. See page 99 for an explanation of compensation. See page 53 for the FLEXmax RTS Compensation menu.

Battery Equalize

CAUTION: Battery Damage

- Do not equalize any sealed battery types (VRLA, AGM, Gel, or other) unless approved by the manufacturer. Some batteries may suffer severe damage from equalization.
- Contact the battery manufacturer for recommendations on equalization voltage, duration, schedule, and/or advisability. Always follow manufacturer recommendations for equalization.

This menu controls the settings for the equalization process, which is used for battery maintenance. See page 45 for an explanation of equalization and how it relates to the regular charging process.

Grid-Tie Mode

IMPORTANT:

This mode requires a grid-interactive inverter model (also known as grid-tie enabled). Not all inverters are grid-interactive. If the system is connected to an inverter that is not grid-interactive, Grid-Tie mode will not function if selected.

This menu allows the charge controller to work more effectively with any grid-interactive inverters present on the HUB. See pages 47, 51, and 104 for more information.
Auxiliary Output (Charge Controller)

This menu controls the output and functionality of the Auxiliary (Aux) output. The charge controller’s Aux terminals provide a 12 Vdc output that can deliver up to 0.2 Adc to control external loads. Typical loads include signaling a generator to start, sending a fault alarm signal, or running a fan to cool the inverter. See page 13 for an image of the Aux terminals. See page 30 for a description of Aux modes.

Aux Modes for the Charge Controller

Aux Modes include nine options with automatic criteria. The options appear in the following order when the wheel is drawn clockwise. The Vent Fan option appears first if the charge controller is set at factory default values; otherwise, it will tend to display the last option selected. (The options are described in greater detail beginning on page 32.)

NOTE: The Remote option allows a MATE3-class system display to use the Aux output for AGS (see page 44). AGS is intended for systems with a HUB, inverter, and FLEXmax. If the system display connects only to a FLEXmax, AGS will only work with DC genset programming. The other AGS functions will not work properly.

Vent Fan

PV Trigger

Error Output
Night Light

Set Points:
- **Active**: High or Low.
- **Threshold**
- **Hysteresis Time**
- **ON Time**

*Figure 70 Night Light*

Float

Set Points: None

*Figure 71 Float*

Diversion: Relay and Solid St

Set Points (NOTE: All items function identically for both *Diversion: Relay* and *Diversion: Solid St*, except for **Active**: High or Low):
- **Active**: High or Low. (Not present in *Diversion: Solid St*)
- **Relative Voltage**
- **Hysteresis**
- **Hold**
- **Delay**

*Figure 72 Diversion:Relay and Diversion: Solid St*

Low Batt Disconnect

Set Points:
- **Disconnect**
- **Re-Connect**
- **Disconnect Delay**

*Figure 73 Low Batt Disconnect*

Remote

Set Points: None
This mode can also be used for the AGS function. See pages 44 and 68 for important information on this function.

*Figure 74 Remote*

Restart Mode

This item selects between continuous MPPT, or occasional restarts. (See pages 23 and 55.)

Set Points:
- **0** – Continuous MPPT, **1** – Automatic re-sweep every 90 minutes in MPPT charging, **2** – Automatic re-sweep every 90 minutes in any mode.

*Figure 75 Restart Mode*
**Calibrate**

The Calibrate menu allows adjustment of the charge controller’s battery voltmeter. If a particular controller’s readings do not match those of another device, or a hand-held meter, the calibration feature may improve consistency.

**NOTE:** Calibration does not change the actual voltage of the charge controller, only the reading of that voltage.

Also, measurements in places other than the charge controller’s terminals may differ regardless of calibration. For example, it is possible to get a different reading at the charge controller’s DC terminals than on the batteries. Connection problems, corrosion, and the effects of induction and resistance may all result in voltage differences. If this occurs, note that this is an issue with the system, not the charge controller. Calibration cannot correct for it.

**Reset Charge Controller to Factory Defaults**

This menu allows the user to erase all settings from the selected charge controller and start over with the values programmed at the factory. These values are listed on page 96.

To access the Reset to Factory Defaults menu:

1. Access the main menu as shown in Figure 16.
2. Select the **Settings** menu. (This option may be highlighted by default.)
3. Select **Charge Controller** in the device **Settings** menu.
4. Select the **Reset to Factory Defaults** menu.
5. Use the soft keys to select **No** or **Yes**.
   - If **No** is selected, the screen returns to the **Charge Controller** menu. No changes will be made to any settings.
   - If **Yes** is selected, the inverter’s settings will immediately change to the original factory values. The screen will display the message **Charge Controller Restored to Factory Defaults**.
     A **<Continue>** soft key will appear. Pressing this key will return the screen to the **Charge Controller** menu.
6. After resetting the charge controller to factory default parameters:
   - press the **<Continue>** soft key or the Up navigation key to return to the **Charge Controller** menu, or
   - press the Top navigation key to return to the **Settings** menu.

**Figure 77 Restoring the Charge Controller to Factory Default Settings**
Device Data Logs

Users of the MATE3 or MATE3s can create Device Data Logs for the FLEXmax charge controller. The Data Logs can then be uploaded and saved to an SD card.

Saving Data Logs for the FLEXmax Controller

To create a data log for the FLEXmax Charge Controller:

1. Access the Main Menu as shown in Figure 16.
2. Select the Device Data Logs menu.
3. Select FLEXmax Charge Controller menu.
4. Select Upload and Save Data Log on the FM Charge Controller Data Log menu.
5. Select one of the two options.
   - Press <New> to give the new data log a unique name. Or
   - Press <Save> to save the data log over the name that is highlighted on the list.
6. After saving the data log is complete, press <Continue> to return to the Upload and Save Data Log screen.

To save a new data log over the name highlighted on the list:

1. Use the control wheel to scroll through the list.
2. When the name to be replaced is highlighted, press <Save>.
3. Wait for the message confirming that the profile has been saved to the SD card.
4. Press <Continue> to return to the Upload and Save Data Log menu.

To create a new name for the data log (up to 8 characters maximum):

1. Use the control wheel to scroll through the available characters.
2. Use <→> and <←> to move to the next character location.
3. Press <Delete> to erase the character that is highlighted.
4. Press <Save> to save the new data log on the SD card.
4. Press <Continue> to return to the Upload and Save Data Log menu.

Figure 78 Uploading and Saving a Data Log for the FLEXmax
Data Log File Format

Information generated by this function will be saved on the SD card in a generic .csv file format, which can be read by most spreadsheet programs.

Figure 79 Data Log Example for the Charge Controller
MATE-Class System Display and Controller

This section covers the use of both the MATE and MATE2 products.

**Summary Screens**

If a FLEXnet DC (FN-DC) is installed in the system, the following summary screens will be available.

- **FLEXnet DC Summary Screen #1**

- **FLEXnet DC Summary Screen #2**

- **FLEXnet DC Summary Screen #3**

- **FLEXnet DC Summary Screen #4**

(If the FN-DC is not installed, this will be the first Summary Screen.)

---

**Figure 80 Summary Screens**

- **FX Inverter/Charger Summary Screen**

- **FLEXmax Charge Controller Summary Screen**
**Status Screens**

To view the status screens of a FLEXmax 60 or FLEXmax 80 using a MATE, follow the illustration below. Changes to FLEXmax settings can only be changed from the charge controller user interface; changes cannot be done when viewing these screens on a MATE.

**MODE Screens**

**Navigation for STATUS/CC/MODE**
- `<STATUS>` returns to the STATUS/CC/PAGE1 screen.
- `<DOWN>` moves to the next menu item in the diagram.
- `<UP>` moves to the previous menu item in the diagram.
- `<TOP>` returns to the first CC/MODE screen for the port shown.
- `<PORT>` directs the system display to read the next device (port) on the HUB.

**Charge Controller Modes**

The MODE screens describe the current operating mode for the FLEXmax charger (see page 22) and Aux output (see page 30).

The FLEXmax has over 25 modes. The MATE can only display five status messages and may substitute one of the five for a FLEXmax mode not on this list. Check the FLEXmax status screen to determine its exact mode.

**charger mode:**
- Bulk
- Absorption
- Float
- Silent
- Equalization

**aux relay mode:**
- vent fan
- pv trigger
- error output
- night light
- float
- diversion: relay
- diversion: solid st
- low batt(ery) disconnect
- remote

**aux relay state:**
This screen indicates if the AUX output is
- ON
- OFF

**Figure 81 MODE Screens**
METER Screens

Navigation for STATUS/CC/METER
- **<STATUS>** returns to the CC/PAGE1 screen.
- **<DOWN>** moves to the next menu item in the diagram.
- **<UP>** moves to the previous menu item in the diagram.
- **<TOP>** returns to the first CC/METER screen for the port shown.
- **<PORT>** directs the system display to read the next device (port) on the HUB.

Charge Controller METER Screens

The METER screens display readings for power, current, and voltage handled by the FLEXmax. (See page 74 for more information on the mode messages displayed here.)

**mode/pv-in/bat-out:**
- **mode** (charger):
  - Bulk
  - Absorption
  - Float
  - Silent
  - Equalization
- **in vdc** (PV array voltage)
- **adc** (incoming PV current)
- **out vdc** (battery voltage)
- **adc** (outgoing current delivered to the battery)

**charger watts**: Charger output to the battery (watts).

**charger kwhrs**: Kilowatt-hours sent to the batteries today.

**charger amps dc**: Charger current to the battery (Adc).

**battery voltage**: Battery voltage (Vdc).

**panel voltage**: PV array voltage (Vdc).

**CC Firmware revision**: The level of the last revision or programming upgrade to the FLEXmax.
SETPT Screens

Navigation for STATUS/CC/SETPT

- `<STATUS>` returns to the `CC/PAGE1` screen.
- `<DOWN>` moves to the next menu item in the diagram.
- `<UP>` moves to the previous menu item in the diagram.
- `<TOP>` returns to the first `CC/SETPT` screen for the port shown.
- `<PORT>` directs the system display to read the next device (port) on the HUB.

Charge Controller SETPT
(set point) Screens

The SETPT screens display the current settings for the FLEXmax battery charger, as described on page 29.

- `Absorb`
- `Float`
LOG Screens

Navigation for STATUS/CC/LOGS

- `<STATUS>` returns to the CC/PG2 screen.
- `<DOWN>` moves to the next menu item in the diagram.
- `<UP>` moves to the previous menu item in the diagram.
- `<TOP>` returns to the 1st CC/LOG1 screen for the port shown.
- `<PORT>` directs the system display to read the next device (port) on the HUB.
- `<DAY->>` displays log information from one day earlier. Logs can be displayed from as far as 128 days in the past.
- `<DAY->>` displays log information from one day later. If the present day is displayed, then pressing this key will return the log to 128 days in the past.

Charge Controller Logs

The LOG screens contain information collected from the FLEXmax on individual days. These logs include daily accumulated amp-hours and kilowatt-hours, and peak readings for power, current, and voltage. It also includes the timers for the FLEXmax battery charger. This data is the same as that shown on the FLEXmax End-of-Day Summary screen (see page 20.)

Log 1 Today:

- `AH` (accumulated battery amp-hours)
- `Kwh` (accumulated battery kilowatt-hours)
- `Vp` (peak PV voltage)
- `Ap` (peak PV current)
- `kWp` (peak PV kilowatt-hours)

Log 2 Today:

- `max V` (maximum battery voltage)
- `min V` (minimum battery voltage)

Log 3 Today:

- `absorb` timer
- `float` timer
STAT Screens

Navigation for STATUS/CC/STAT

- <STATUS> returns to the CC/PAGE2 screen.
- <DOWN> moves to the next menu item in the diagram.
- <UP> moves to the previous menu item in the diagram.
- <TOP> returns to the CC/STAT/PAGE2 screen for the port shown, with the exception of the "end of the cc stats" menu. From the "end" menu, the <TOP> soft key returns to the 1st CC/STAT screen.
- <PORT> directs the system display to read the next device (port) on the HUB.

**Charge Controller Stats**

The STAT screens contain historical data for the FLEXmax, including peak voltages, peak wattage, and total accumulations. (See page 58.)

- maximum battery \( V_{dc} \):
- \( V_{oc} \):
- max voc:
- maximum wattage:
- total kWH DC:
- total kAH:

**Figure 85 STATUS STAT Screens**
Advanced Menus

The Advanced menus available in the MATE or MATE2 system display allow any of the following options:

- Change the settings of the FLEXmax battery charger and temperature compensation
- Change the parameters of the FLEXmax MPPT process
- Change the settings of the FLEXmax equalization process
- Calibrate the FLEXmax meters
- Change the settings of the Aux output to run small AC or DC loads
- Start a generator using Advanced Generator Start (AGS) Mode (see page 44)
- Adjust the settings or functions of other OutBack devices which are connected to the system display (see appropriate manuals)

The following pages detail the MATE, or MATE2, Control Modes. Please note whenever a password is called for, the system password is:

141

Accessing the Advanced Menus

- Press any soft key to advance to the next screen.
- Press the <INC> soft key until 132 becomes 141.
- Press <ENTER> when the number 141 is displayed. This will proceed into the ADV choose device menu in the Advanced menu map.
- Press <EXIT> to return to the Main Menu without changing the password.
CHGR Menu

Navigation for ADV/CC/CHGR
- <DOWN> moves to the next menu item in the diagram.
- <INC> increases the value of the selection.
- <DEC> decreases the value of the selection.
- <PORT> directs the system display to read the next device (port) on the HUB.
- <ADV> returns to the CC/PAGE1 screen.
- <TOP> returns to the CC/CHGR screen.
- <MAIN> exits the Advanced menus and returns to the Main Menu (see page 79).

CC/Charger
The CHGR screens adjust the same settings that are available on the Charger screen in the FLEXmax (see page 29).
- output current limit
- absorb voltage
- float voltage

Figure 87  ADV Menu for Charging Features
CC ADVANCED Menu

CC/Advanced
The ADVANCED screens adjust the same settings that are available on the Advanced screen in the FLEXmax (see page 49). These settings relate to charging, MPPT, temperature compensation, and calibration.

Navigation for ADV/CC/ADVANCED
- <DOWN> moves to the next menu item in the diagram.
- <INC> increases the value of the selection.
- <DEC> decreases the value of the selection.
- <PORT> directs the MATE to the next device (port) on the HUB.
- <TOP> returns to the CC/ADVANCED screen.
- <ADV> returns to the CC/PAGE1 screen.
- <MAIN> exits the Advanced menus and returns to the Main Menu (see page 79).

Figure 88 ADV Menu for the Advanced Charging Features
Figure 89 ADV Menu for EQ Charging Features
AUX Menu

**Navigation for ADV/CC/AUX**
- `<DOWN>` moves to the next menu item in the diagram.
- `<INC>` increases the value of the selection.
- `<DEC>` decreases the value of the selection.
- `<PORT>` directs the system display to read the next device (port) on the HUB.
- `<TOP>` returns to the `CC/PAGE2` screen.
- `<ADV>` returns to the `choose device` screen.
- `<MAIN>` exits the Advanced menus and returns to the Main Menu (see page 79).

**CC/AUX**
The Aux screens adjust the same settings that are available on the Aux screen in the FLEXmax (see page 30).

- **Aux mode:**
  - vent fan
  - pv trigger
  - error output
  - night light
  - float
  - diversion: relay
  - diversion: solid st
  - low batt(ery) disconnect
  - remote

The remote mode also can be used for the system display’s AGS function. See page 44.

**NOTE:** The AGS function is only intended for use in systems with a HUB, inverter, and FLEXmax. If the system display connects only to a FLEXmax, the only AGS function that will work is the DC genset programming. The other AGS functions will not work properly.

**NOTE:** The system display must have firmware revision 4.1.6 or higher for AGS to work.

**aux control**
- `ON`
- `OFF`
MATE and MATE2 FLEXmax Menu Maps

STATUS Menu Map

Navigation for
STATUS/CC/PAGE1

- `<DOWN>` moves to the next menu item in the diagram.
- `<UP>` returns to the previous menu item in the diagram.
- `<PORT>` directs the system display to read the next device (port) on the HUB.
- `<TOP>` returns to the STATUS/CC/PAGE1 screen.
- `<STATUS>` returns to the screen at the top of the respective column.

# Troubleshooting

**IMPORTANT:**

Be sure to check out the OutBack customer and user forum at www.outbackpower.com/forum/ for more FLEXmax information.

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Remedy</th>
</tr>
</thead>
</table>
| FLEXmax does not boot/power-up (blank LCD) | ✷ Check the battery connection and polarity. Reverse polarity or an improper connection will cause power-up issues.  
 ✷ Check the battery disconnect or circuit breaker. Ensure all circuit breakers are sized appropriately.  
 ✷ Check the battery voltage at the FLEXmax terminals. A battery voltage below 10.5 Vdc may not power up the FLEXmax. A poor connection may not allow sufficient voltage to reach the FLEXmax. |
| FLEXmax not producing expected power | ✷ Check PV conditions. Clouds, partial shading, or dirty panels can cause poor performance.  
 ✷ Check settings. The lower current limit set point in the **Charger** menu will yield a loss of power or poor performance symptoms. If the FLEXmax is in **U-Pick** mode, it may not track at the maximum power point.  
 ✷ Check battery conditions and charging stage. If the batteries are charged (if the FLEXmax is in the Absorbing or Float stage), the FLEXmax will produce only enough power to regulate the voltage at the Absorbing or Float set point voltage. Less power is required during these stages.  
 ✷ Determine the specified short-circuit current of the PV array. The MPP current is related to this number. Use a multimeter to determine if the short-circuit current is in the expected range. Array or wiring problems may restrict the available power.  
 ✷ Check the PV array temperature. At high temperatures, the maximum power point voltage may be near or lower than the battery voltage. |
| FLEXmax not equalizing | ✷ Make certain the equalization cycle has been started.  
 ~ In the **EQ** menu, press START to begin the process. When the equalization cycle has been initiated, **MPPT EQ** will be displayed.  
 ✷ The equalization cycle has been initiated, but the battery is not equalizing.  
 ~ The cycle will begin when the target EQ set point voltage has been reached. A small array or cloudy weather will delay the EQ cycle. Running too many battery loads will also delay the cycle.  
 ~ Check the PV array temperature. At high temperatures, the maximum power point voltage may be near or lower than the battery voltage. This can delay the cycle. |
## Troubleshooting

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Remedy</th>
</tr>
</thead>
</table>
| FLEXmax is always SLEEPING                   | - Check battery voltage. If the battery voltage is at or above the Absorbing voltage set point (compensated for battery temperature), the FLEXmax will not wake up.  
- Check PV voltage. The PV voltage has to be at least two volts greater than the battery voltage for the initial wakeup.  
- If voltage is not present, check the PV array breaker (or fuse). Confirm the PV array breaker (or fuse) is sized appropriately. |

Applications

Maximum Power Point Tracking

Maximum Power Point Tracking (MPPT) is the technology used by FLEXmax controllers to optimize the harvest of power from PV arrays.

PV modules do not have a defined operating voltage. Their voltage is defined strictly by the load connected to them. With no load (disconnected), a module displays “open-circuit” voltage (Voc), and delivers no current. At full load (shorted), a module has no voltage, although it delivers the maximum “short-circuit” current (Isc). In neither case does the module produce usable wattage.

When partially loaded, a PV module delivers partial current and voltage. These numbers can be multiplied to see the available wattage. However, the delivery of wattage is not linear. The current and voltage delivered at a given load will change with the load, along a curve such as that shown in the drawing to the left in Figure 99. This is known as the V-I curve. The wattage is different at every point along the curve. (The V-I curve also varies with module type and manufacturer.) Only one point on the curve represents the delivery of the module’s maximum (rated) wattage. This is known as the maximum power point, or MPP. The current at this point, Imp, is the highest that can be drawn while still maintaining the highest voltage, Vmp.

The FLEXmax controller places a variable load on the PV array and tracks the result to determine the maximum power point. This process, MPPT, is maintained so that the FLEXmax can deliver the maximum PV power regardless of any change in conditions. The drawing to the right in Figure 99 shows the MPP and compares the V-I curve against the available wattage.

![Figure 99 Maximum Power Point Tracking](image)

**Figure 99** Maximum Power Point Tracking
Three-Stage Battery Charging

The FLEXmax charge controller is a sophisticated, multi-stage battery charger that uses several regulation stages to allow fast recharging of the battery system while ensuring a long battery life. This process can be used with both sealed and non-sealed batteries. The FLEXmax is a “buck” converter which turns higher PV voltages into the lower charging voltages used by batteries (with correspondingly higher currents). The chart in Figure 100 shows the voltage levels achieved by the PV array throughout a typical day, and the battery voltages (by stage) during the same times.

The FLEXmax has preset recharging voltage set points (Absorbing and Float voltages); however, OutBack always recommends using the battery manufacturer’s recommended charging voltages.

A new charge cycle is started any time the battery voltage decreases below the Rebulk set point. (See page 53.) This usually occurs each night unless the batteries were maintained by another means. (If so, they may not need to be recharged). See pages 22 through 26 for the messages displayed onscreen during the various stages.

**BULK**

This is the first stage in the three-stage charge cycle. It is a constant-current stage which drives the battery voltage up. The DC current is the maximum current the charger can deliver. This stage typically leaves the batteries at 75% to 90% of their capacity, depending on conditions.

In the Bulk stage, the FLEXmax will charge the batteries to the Absorbing voltage setting (see page 29). This stage is not timed. It will charge as long as necessary to complete the stage, regardless of any timer set points. If little PV energy is available, it may take a long time for this stage to complete. If the FLEXmax is in a different stage and little PV energy is available, it may return to Bulk. (See page 22.) This stage is temperature-compensated. (See page 99.)
ABSORBING

This is the second stage of charging. It is a constant-voltage stage. Current varies as needed to maintain the Absorbing voltage setting. However, it will typically decrease to a very low number over time. This “tops off the tank”, leaving the batteries at essentially 100% of capacity.

The duration of the Absorbing stage is the user-defined Absorb Time Limit. The ChgT timer is preset to zero following the previous charge cycle. Once in Absorbing, ChgT will count until it reaches this limit. (See pages 22, 47, and 51.) The charger will then exit Absorbing and enter the Float stage. The charger will also also exit Absorbing if the Absorb End Amps setting is reached, regardless of the timer. This resets the timer to zero. (See page 47.) This stage is temperature compensated. (See page 99.)

FLOAT

When the charger enters this stage, it reduces the voltage to prevent battery overcharging. The batteries are maintained at the Float set point. Floating is displayed on the screen. This stage is not timed. The FLEXmax will continue to maintain Float as long as PV energy is available.

If the PV cannot supply enough power to maintain the Float set point, the FLEXmax will not immediately initiate a new charge cycle. It will attempt to draw more PV energy and recharge the battery until the Float voltage set point is reached. When this occurs, MPPT Float is displayed (see page 25). This stage is temperature compensated. (See page 99.) A new cycle can be initiated if the voltage falls below the ReBulk set point (see page 53).

Battery Temperature Compensation

Battery performance changes when the temperature varies above or below room temperature (77°F or 25°C). Compensation is a process that adjusts charging to correct for these changes.

When a battery is cooler than room temperature, its internal resistance goes up and the voltage changes more quickly. This makes it easier for the charger to reach its voltage set points. However, while accomplishing this process, it will not deliver all the current that the battery requires. As a result, the battery will tend to be undercharged.

Conversely, when a battery is warmer than room temperature, its internal resistance goes down and the voltage changes more slowly. This makes it harder for the charger to reach its voltage set points. It will deliver energy as time passes until the set points are reached. However, this tends to be more than the battery requires, meaning it will tend to be overcharged.

The FLEXmax controller, when equipped with the Remote Temperature Sensor (RTS) will compensate for temperature. The RTS is attached to a single battery near the center of the bank. When charging, the RTS will increase or decrease the charge voltage by 5 mV per degree Celsius per battery cell. This setting affects the Absorbing and Float set points. Equalization is not compensated in the FLEXmax.

- In a 12 Vdc system (6 cells, 2 volts each), this means 0.03 volts per degree Celsius above or below 25°C. Maximum compensation is ± 0.6 Vdc.
- In a 24 Vdc system (12 cells, 2 volts each), this means 0.06 volts per degree Celsius above or below 25°C. Maximum compensation is ± 1.2 Vdc.
- In a 48 Vdc system (24 cells, 2 volts each), this means 0.12 volts per degree Celsius above or below 25°C. Maximum compensation is ± 2.4 Vdc.

Examples:
- A 12 Vdc system with 10°C batteries will compensate its charging to 0.45 Vdc higher than the set points.
- A 24 Vdc system with 35°C batteries will compensate its charging to 0.6 Vdc lower than the set points.
- A 48 Vdc system with 15°C batteries will compensate its charging to 1.2 Vdc higher than the set points.
Array Design

Sizing Guidelines

Below is a list of maximum array wattages for the FLEXmax for various nominal voltage batteries. This should be used for sizing an array. Note that every PV module is different. The specifications for every model should be consulted before designing or assembling a PV array.

Open Circuit Voltage (V<sub>oc</sub>)

Open-circuit voltage (V<sub>oc</sub>) is the unloaded voltage generated by the PV array. The FLEXmax controller can withstand V<sub>oc</sub> of up to 150 Vdc. However, if the V<sub>oc</sub> exceeds 145 Vdc, the FLEXmax will suspend operation to protect the system components.

CAUTION: Equipment Damage

Although the FLEXmax shuts down when voltage is greater than 145 Vdc, this will not prevent the array from generating voltage. Anything higher than 150 Vdc will damage the FLEXmax, whether it has shut down or not. The array should be designed so that voltage never exceeds 145 Vdc in order to prevent equipment damage.

Weather Conditions

Cooler climates can cause the V<sub>oc</sub> to rise above the array’s rated V<sub>oc</sub>. In climates that observe temperatures less than about –15°C (5°F), a V<sub>oc</sub> greater than 125 Vdc is not recommended.

- Hot weather: lower V<sub>oc</sub> and lower V<sub>mp</sub>
- Cold weather: higher V<sub>oc</sub> and higher V<sub>mp</sub>

If the specific voltage temperature correction factor is not known for a particular module, allow for ambient temperature correction using the following information:

- 25° to 10°C (77° to 50°F) multiply V<sub>oc</sub> by 1.06
- 9° to 0°C (49° to 32°F) multiply V<sub>oc</sub> by 1.10
- –1° to –10°C (31° to 14°F) multiply V<sub>oc</sub> by 1.13
- –11° to –20°C (13° to –4°F) multiply V<sub>oc</sub> by 1.17
- –21° to –40°C (–5° to –40°F) multiply V<sub>oc</sub> by 1.25

---

1 Based on the most common solar arrays under Standard Test Conditions (1000 watts per square meter to solar panel at 25°C [77°F]).
Maximum-Power Voltage ($V_{mp}$)

Maximum-power voltage ($V_{mp}$) is the operating voltage for the PV array at which the array generates the most wattage. When designing the PV array, it is recommended for the $V_{mp}$ to be approximately 12 to 24 volts higher than the nominal battery voltage for optimum performance. This will ensure that the $V_{mp}$ is always above the battery voltage, which is required for charging. Higher voltages are not recommended, as they may reduce the FLEXmax conversion efficiency.

**IMPORTANT:**
Check the PV array voltage before connecting it to the FLEXmax.

Standard vs. Australian Default Settings

Several version settings are available for the FLEXmax upon initial setup. These can be selected upon initial power-up. (See page 17.) The English and Spanish versions have the same standard default settings; however, the Australian version has certain default settings that are different. However, there are no differences in performance and efficiency between the two versions. The standard and Australian version can be identified as follows:

**Figure 101 Standard vs. Australian Power-up Screens**
Hydroelectric and Fuel Cell Applications

Performance Optimization

The FLEXmax Charge Controller is designed to work with PV arrays. Although it will work with hydroelectric turbines and fuel cells, OutBack Power Technologies can only offer limited technical support for these applications due to variance in turbine and fuel cell specifications.

IMPORTANT:
The FLEXmax Charge Controller is not usable for direct regulation of wind turbine input and OutBack cannot warranty its use in these applications. In wind turbine applications, the FLEXmax is recommended as a diversion controller. (See page 38.)

The FLEXmax maximum power point tracking (MPPT) function can be set to Auto Track or U-Pick% mode as described on page 51. The MPPT function is based on the open-circuit voltage (V_{oc}) of the DC source. This is the unloaded voltage displayed by the source when it is disconnected. MPPT values are expressed as a percentage of V_{oc}. Auto Track mode allows the FLEXmax to sweep the range of percentages. The Auto Track mode begins at the maximum value and loads the array, working its way through lower voltages, until it locates the input voltage that yields maximum wattage.

Auto Track Mode

The default minimum value of Auto Track is 1/2 (50% of V_{oc}). The default maximum is 90% of V_{oc}. This is the standard maximum-power range for PV. A hydroelectric or fuel-cell system’s operating voltage may operate in a different range and often have a maximum-power voltage close to the battery voltage. The FLEXmax allows a user to set a sweep range more appropriate for the source. The minimum setting can be changed to FULL, which is 40% of the V_{oc}. The maximum value can be set from 80% to 99% of V_{oc} if necessary.

This adjustment only affects the initial tracking at the beginning of the day and any subsequent trackings caused by Auto-Restart or any forced restart of the FLEXmax.

U-Pick Mode

If an optimal voltage is known for a given DC source, then this voltage can be set as a designated V_{oc} percentage in U-Pick% mode. This percentage is assigned in the Park Mpp set point, which allows a range of 40% to 99% of V_{oc}. If U-Pick % Voc is chosen, the FLEXmax will load the source to operate continuously at the designated voltage. It will not sweep for the maximum power point and will ignore all Auto Track values.
To adjust the **Lower Mpp Range Limit**:

1. From the main menu, press $$\leftrightarrow$$ to move the arrow next to the **Advanced** function.

2. Press $$<\text{GO}>$$.

3. In the **ADVANCED MENU** screen, press $$<\text{NEXT}>$$ again to display the **Mpp Range Limit % Voc** screen.

4. Press $$<1/2>$$ until **FULL** appears.

5. When finished, press $$<\text{NEXT}>$$ until the **MPPT Mode** screen appears.

To pick between **Auto Track** or **U-Pick % MPPT** Mode and determine the charge controller’s operating $V_{oc}$ percentage, press $$<\text{MODE}>$$ to interchange between the two modes.

Re-entering the password might be required. After choosing a mode, press $$<\text{NEXT}>$$ in the **ADVANCED MENU** to view the **Park Mpp** screen (only applicable for **U-Pick** mode).

Press $$<-\%>$$ or $$<+\%>$$ to select one of the percentage values; **U-Pick** always uses the **Park Mpp** value.

Figure 102  Adjusting Range Limits for Hydroelectric or Fuel-cell Applications
Grid-Interactive Settings

When using an OutBack inverter, FLEXmax, HUB, and system display, set the FLEXmax to **GT** in the Advanced menu. GT mode allows the inverter to manage the FLEXmax Float setting. It ensures the FLEXmax always keeps the battery above the sell voltage of the inverter. (See page 51.)

When using a FLEXmax charge controller with an inverter without the use of a HUB, GT mode will not work because the FLEXmax cannot communicate with the inverter. In this situation, when selling electricity back to the grid, keep the inverter’s “sell” voltage setting below the FLEXmax Float setting. In a 24-volt battery system, the difference should be at least 0.5 Vdc. In a 48-volt system, the difference should be at least 1.0 Vdc.
